

ORDER

DRAFT
DOE O 458.1

Approved: XX-XX-09

RADIATION PROTECTION OF THE PUBLIC AND THE ENVIRONMENT

U.S. DEPARTMENT OF ENERGY
Office of Health, Safety and Security

RADIATION PROTECTION OF THE PUBLIC AND THE ENVIRONMENT

1. PURPOSE.

- a. To establish requirements to protect the public and the environment against undue risk from radiation associated with radiological activities conducted under the control of the Department of Energy (DOE) pursuant to the Atomic Energy Act of 1954, as amended (AEA).
- b. The objectives of this Order are:
 - (1) To conduct DOE radiological activities so that exposure to members of the public is maintained within the dose limits established in this Order;
 - (2) To control the clearance of DOE real and personal property;
 - (3) To ensure that potential exposures to members of the public are as low as is reasonably achievable;
 - (4) To ensure that DOE sites have the capabilities, consistent with the types of radiological activities conducted, to monitor routine and non-routine radiological releases and to assess the dose to members of the public; and
 - (5) To provide protection of the environment from the effects of radiation and radioactive material.

2. CANCELLATION. DOE 5400.5, *Radiation Protection of the Public and the Environment*, Chg 2, dated 1-7-93. Cancellation of a directive, does not, by itself, modify or otherwise affect any contractual or regulatory obligation to comply with the directive. Contractor Requirements Documents (CRDs) that have been incorporated into a contract remain in effect unless and until the contract is modified to either eliminate requirements that are no longer applicable or substitute a new set of requirements.

3. APPLICABILITY.

- a. Departmental Applicability.
 - (1) This Order applies to all Departmental elements that are responsible for, or provide support for, the management and operation of DOE sites conducting radiological activities or management of DOE radioactive material or property that can result in exposures of the public to radiation or radioactive material.
 - (2) The Administrator of NNSA must assure that NNSA employees and contractors comply with their respective responsibilities under this Directive. Nothing in this Order will be construed to interfere with the

NNSA Administrator's authority under section 3212(d) of Public Law (P.L.) 106-65 to establish Administration-specific policies, unless disapproved by the Secretary.

b. DOE Contractors.

- (1) Except for the equivalencies/exclusions in paragraph 3c the Contractor Requirements Document (CRD) sets forth requirements of this Order that will apply to contracts that include the CRD.
- (2) The CRD must be included in contracts under which the contractor manages or conducts radiological activities at DOE sites.

c. Equivalencies/Exemptions for DOE O 458.1. Equivalencies and Exemptions are granted consistent with the provisions of DOE 251.1C.

- (1) Equivalency. Activities regulated by the Nuclear Regulatory Commission (NRC) including those conducted by the Office of Civilian Radioactive Waste Management, or regulated by an NRC Agreement State under NRC AEA delegated authorities.
- (2) Equivalency. In accordance with the responsibilities and authorities assigned by Executive Order 12344, codified at 50 USC sections 2406 and 2511, and to ensure consistency through the joint Navy/DOE Naval Nuclear Propulsion Program, the Deputy Administrator for Naval Reactors (Director) will implement and oversee requirements and practices pertaining to this Directive for activities under the Director's cognizance, as deemed appropriate.

4. REQUIREMENTS.

a. Establishment and Implementation of an Environmental Radiological Protection Program (ERPP).

- (1) Each DOE organization that conducts radiological activities must develop and implement a documented Environmental Radiological Protection Program (ERPP). This documentation [ERPP Plan(s)] may include by reference sections or chapters of other documents or materials that are applicable for documenting plans, procedures, and schedules for compliance with this Order. Sites with multiple ERPPs must ensure that site-wide environmental radiological aspects are integrated into each ERPP.
- (2) Radiological activities must be conducted in accordance with the applicable ERPP Plan(s).

- (3) ERPP Plan(s) are to be incorporated into site Environmental Management Systems (EMSs) required under DOE O 450.1A, *Environmental Protection Program*, dated 6-4-08, to manage, control, and mitigate the environmental impact of site operations and activities, including radiological activities.
- (4) Commensurate with the nature of the DOE radiological activities at the site, and the risk to the public and the environment, the ERPP must address each requirement of this Order and at minimum, include the following information:
 - (a) Identification of existing or anticipated DOE radiological activities subject to the requirements of this Order.
 - (b) A listing of plans, procedures, and other documents or means used to implement and demonstrate compliance with the requirements of this Order.
 - (c) An “As Low As Reasonably Achievable” (ALARA) Program (See paragraph 4.d of this Order).
 - (d) Process and Historical Knowledge Evaluation Process [See paragraph 4.k(5) of this Order].
 - (e) Environmental Monitoring

1 Environmental monitoring must be conducted to characterize releases of radioactive material from radiological activities, estimate the dispersal pattern in the environs, characterize the pathway(s) of exposure to members of the public and estimate the doses to individuals and populations in the vicinity of the site or operation. Radiological monitoring must be integrated with the general environmental and effluent monitoring required as part of the EMS in DOE O 450.1A paragraph 4.c. Environmental monitoring must include, but is not limited to:

- a Effluent Monitoring. Liquid and gaseous effluent samples must be collected and analyzed or measurements of liquid and gaseous effluents performed to characterize and quantify radiological contaminants and process stream characteristics, assess radiation exposures of members of the

public, and demonstrate compliance with applicable standards.

- b Environmental Surveillance. Samples of air, water, soil, foodstuffs, biota, and other media at the site and surrounding environs must be collected and analyzed and external radiation measured to demonstrate compliance with applicable standards, assess the radiation dose to members of the public, and assess effects, if any, on the environment.
- c Meteorological Monitoring. Meteorological monitoring must be commensurate with the level of site radiological activities, the site topographical characteristics, and the distance to critical receptors. The scope must be sufficient to characterize atmospheric dispersion and model the dose to members of the public from routine and non-routine emissions, over distances commensurate with the magnitude of potential source terms and possible pathways to the atmosphere.
- d Pre-operational Monitoring. Prior to the startup of a new site, facility or process which has potential to expose the public or environment to radiation or radioactive material, the site and surrounding area must be characterized to ensure adequate knowledge of radiological background and the pertinent pathways and parameters for assessing potential human exposures or ecological/natural resource impacts. Data from existing monitoring and surveillance programs and NEPA studies may be summarized or cited to satisfy this requirement. If data from existing programs are not sufficient then data must be collected through a pre-operational study initiated at least one year prior to startup of operations. This information will provide a baseline for future effluent monitoring and environmental surveillance programs.

- 2 Site-specific environmental monitoring criteria must be established to ensure that representative measurements of quantities and concentrations of radiological contaminants are conducted and that the effects from DOE radiological activities on members of the public, the environment and

natural resources are monitored sufficiently to demonstrate compliance with this Order.

3 Ground Water Protection Program. A Ground Water Protection Program must be developed and implemented to protect ground water from radiological contamination and must be integrated with monitoring necessary to implement ground water protection activities required by DOE O 450.1A, paragraph 4.c(2)(c). This program must:

- a Document the baseline condition of the ground water quantity and quality;
- b Identify and assess the possible sources of, and potential for, radiological contamination;
- c Describe the strategies to control radiological contamination; and
- d Describe the monitoring methodologies.

(f) ERPP Plans must include, or reference, documentation that details radiological protection plans and procedures to manage, store, and dispose of radioactive waste, including low-level radioactive waste, transuranic radioactive waste, high-level radioactive waste, spent nuclear fuel, byproduct material as defined in Section 11e.(2) of the AEA, accelerator-produced material, or technologically enhanced naturally occurring radioactive material (TENORM).

The waste management section of ERPP Plans for DOE radiological activities must contain directly, or by reference, plans or procedures (e.g., DOE M 435.1, *Radioactive Waste Management*, dated 7-9-99, plans or procedures) that address the radiological protection of the public and the environment, including:

- 1 Basis for controls to ensure compliance with this Order and with applicable Federal statutes and regulations;
- 2 Description of the means used to limit public access to waste;
- 3 Description of the interim and long-term strategies for managing waste;

- 4 Description of measures to limit biological intrusion into waste disposal sites;
 - 5 Description of administrative safeguards;
 - 6 Description of the mechanisms for cooperating with State and local officials; and
 - 7 References for the management programs that ensure compliance with requirements related to public dose limits, property clearance, and ground water protection.
- (g) Describe programs and procedures used for the radiological clearance of property.
- (h) Describe programs and procedures for implementing long-term stewardship and institutional controls, as necessary, consistent with DOE P 454.1, *Use of Institutional Controls*, dated 4-9-03, and in accordance with DOE O 430.1B, *Real Property Asset Management*, dated 2-8-08, and DOE O 580.1, *Department of Energy Personal Property Management Program*, dated 12-5-05, for closed, deactivated, cleared or transferred sites, facilities, processes, or property which have the potential for radiological exposure to the public or the environment.
- (5) The responsible Field Element Manager¹ must review, concur with, and submit initial ERPP Plans to a Cognizant Secretarial Officer for approval no later than 270 days from the date of issuance of this Order.
- (6) Initial ERPP Plans, or any subsequent revisions, will be considered approved 90 days after submittal unless previously approved or rejected by a Cognizant Secretarial Officer.
- (7) The responsible Field Element Manager must submit an updated ERPP Plan to a Cognizant Secretarial Officer for approval whenever a modification is made to an ERPP Plan, except as provided in paragraph 4.a(8) of this Order.
- (8) Field Element Managers may approve modifications to ERPP Plans if:
- (a) A Cognizant Secretarial Officer is notified of the modifications;

¹ Includes operation office, site office, field office, area office, project office and service center.

- (b) The modifications do not decrease the effectiveness of an ERPP Plan; and
 - (c) An ERPP Plan, as modified, continues to meet the requirements of this Order.
- (9) A Cognizant Secretarial Officer may direct or make modifications to ERPP Plan(s).

b. DOE Public Dose Limit.

- (1) DOE radiological activities, including remedial actions and activities using TENORM, must be conducted so that exposure of members of the public to ionizing radiation will:
 - (a) Not cause a total effective dose (TED)² exceeding 100 mrem (1mSv) in a year, an equivalent dose to the lens of the eye exceeding 1500 mrem (15 mSv) in a year, or an equivalent dose to the skin or extremities exceeding 5000 mrem (50 mSv) in a year, from all sources of ionizing radiation and exposure pathways that could contribute significantly to the total dose excepting:
 - 1 Dose from radon and its decay products in air [Radon is regulated separately e.g., under Title 40 Code of Federal Regulations (CFR) Part 61, Subparts Q and T];
 - 2 Dose received by patients from medical sources of radiation, and by volunteers in medical research programs;
 - 3 Dose from background radiation; and
 - 4 Dose to general employees regulated under 10 CFR Part 835 or NRC license, and
 - (b) Comply with ALARA program requirements in paragraph 4.d of this Order.
- (2) The public dose limit applies to members of the public:
 - (a) Located off DOE sites and on DOE sites and

² The dosimetric quantities based on the results of dose evaluations for such specific pathways may be considered equivalent to the comparable ICRP 60 quantities and combined with the results of other dose evaluations required by this Order for comparison with the DOE public dose limit of 100 mrem (1 mSv) TED per year solely for the purposes of demonstrating compliance with the DOE public dose limit of 100 mrem TED per year, and when required specific pathway dose limits are stated in non-ICRP 60 dosimetric quantities, e.g., effective dose equivalent.

- (b) Exposed to residual radioactive material subsequent to any remedial action or clearance of property.

c. Temporary Dose Limits.

- (1) Special circumstances could affect a DOE radiological activity in such a manner that the potential dose to a member of the public could exceed a TED of 100 mrem (1 mSv) in a year.
- (2) The Field Element Manager may request specific authorization for a temporary public dose limit higher than 100 mrem (1 mSv) in a year from a Cognizant Secretarial Officer in consultation with the Chief Health, Safety and Security Officer. This request must include documentation that justifies the need for the increase, the alternatives considered, and the application of the ALARA process.
- (3) A Cognizant Secretarial Officer must limit approval of such requests to no more than 500 mrem (5 mSv) TED, provided that the average TED over any 5 contiguous years does not exceed 100 mrem per year.
- (4) The specific exposure pathways excepted in paragraphs 4.b(1)(a)1-4 are also excepted for temporary dose limits.

d. As Low As Reasonably Achievable (ALARA) Requirements.

(1) ALARA Program.

- (a) A documented ALARA Program must be established to optimize control and management of releases of radioactive material to the environment, and doses to the general employees and to members of the public (both individual and collective) such that levels are kept as low as is reasonably achievable.
- (b) A documented ALARA Program must include:
 - 1 Statement of commitment to use the ALARA process,
 - 2 Description of the scope of the ALARA program,
 - 3 Description of the means to be used to implement the ALARA process,
 - 4 Description of the process for documenting ALARA decisions, and
 - 5 Description of the training program on implementation of the ALARA process.

- (c) An ALARA Program must take into account the design of new facilities or modification of existing facilities, and must be coordinated with any occupational ALARA Program(s).
- (d) ALARA goals for optimizing control and management of releases of radioactive material to the environment, and exposure to members of the public must be established and documented on an annual basis.

(2) ALARA Process.

- (a) The ALARA process must be applied to the following:
 - 1 The design or modification of facilities, processes, and/or radiological activities that could potentially result in releases of radioactive material to the environment, or exposure to members of the public (both individual and collective).
 - 2 All DOE sources and modes of exposure, and all pathways with the potential to release radioactive materials to the environment, or result in doses to members of the public.
- (b) Societal, environmental, technical, economic, and public policy factors must be considered and evaluated to the extent necessary and practicable in implementing the ALARA process. Factors to be considered, at a minimum, must include:
 - 1 Maximum dose to members of the public;
 - 2 Collective dose to members of the public;
 - 3 Doses to general employees;
 - 4 Nature and levels of environmental releases;
 - 5 Ecological and other environmental impacts;
 - 6 Applicable alternative processes, such as alternative treatments of discharge streams, facility and process designs or modifications, operating methodologies, or controls;
 - 7 Examination of the differences in cost among alternatives; and
 - 8 Societal, technical, and public policy impacts associated with alternatives.

- (c) A graded approach must be applied to the ALARA process.
 - (3) ALARA assessments are applicable to all routine radiological activities. Though not applicable to non-routine radiological events (for example, accidental, unplanned, or inadvertent releases, exposures, or doses), ALARA assessments are applicable to recovery and remediation activities associated with such non-routine events.
- e. Demonstrating Compliance with the Public Dose Limit.
- (1) Dose evaluations to demonstrate compliance with the public dose limit in paragraph 4(b)(1) of this Order and to assess collective dose must include the following:
 - (a) Dose to members of the public from direct exposure to radiation, airborne effluents, liquid effluents, and cleared real property of DOE origin.
 - 1 Compliance may be demonstrated by calculating dose to the representative person or to the maximally exposed individual (MEI).
 - 2 Determination of the representative person or the MEI must include members of the public both on DOE sites and off DOE sites.
 - 3 Dose to the lens of the eye, skin, and extremities must be calculated if the TED for members of the public exceeds 25 mrem (0.25 mSv) in a year, or if it is suspected that any of the dose limits specified in paragraph 4.b(1)(a) of this Order may be exceeded.
 - (b) Analytical models that consider likely exposure pathways, such as:
 - 1 Direct external radiation from sources located on-site;
 - 2 External radiation from airborne radioactive material;
 - 3 External radiation from radioactive material deposited on surfaces off-site;
 - 4 Internal radiation from inhaled airborne radioactive material;
 - 5 Internal radiation from radioactive material ingested with food from terrestrial crops or animal products (e.g., meat, eggs, milk);

- 6 Internal radiation from radioactive material ingested with aquatic food products such as fish, shellfish, crustaceans (e.g., crayfish, shrimp, crab, lobsters), and aquatic plants and algae;
 - 7 External or internal radiation due to residual radioactive material on, or in, cleared real property; and
 - 8 Any other pathway unique to the DOE site or activity.
 - (c) The dose to members of the public from DOE-related exposure sources only, if the projected DOE-related dose to the representative person or MEI is 25 mrem (0.25mSv) in a year or less. If the DOE-related dose is greater than 25 mrem in a year, the dose to members of the public must include both major non-DOE sources of exposure (excluding background radiation dose, occupational doses and doses due to medical exposures) and dose from DOE-related sources;
 - (d) Collective dose for members of the public resulting from radiation emitted and radioactive materials released from DOE radiological activities only (not including radon and its decay products)
Collective dose for members of the public must be representative of the total dose and of adequate quality for supported comparisons, trending or decisions. Consistent with the graded approach, collective dose estimates may be truncated by distance (e.g., 50 miles) or individual dose level (e.g., 10 microrem) when integration of doses beyond such thresholds does not significantly affect data quality objectives. Where it is of concern, collective dose for members of the public resulting from radon and its decay products released by DOE radiological activities needs to be calculated separately from other radionuclides.
- (2) The estimated dose to the MEI or representative person must be based on pathway and exposure parameters for a highly exposed individual or individuals but be as realistic as practicable and not likely to substantially underestimate or overestimate the dose. Collective dose (population dose) must also be as realistic as practicable but is an estimate of the sum of the doses to all members of the actual exposed population.
- (3) Site-specific information on radiation source dispersion patterns, location and demography of members of the public in the vicinity of DOE radiological activities, land use, food supplies, and exposure pathway information must be updated, as necessary, to document significant changes that could affect dose evaluations.

- (4) Values of assumed default or site-specific parameters used in calculations must be identified and included with the documentation of the calculations.
- (5) Direct measurements must be made, to the extent practicable, to obtain information characterizing source terms, exposures, exposure modes, and other information needed in evaluating dose.
- (6) Dose evaluation models that are codified or approved for use by DOE must be used. Alternative dose evaluation models, including those used by other regulatory agencies, national organizations or international organizations, must be approved for use by either the Chief Health, Safety and Security Officer or by the DOE Field Element Manager with the concurrence of a Cognizant Secretarial Officer and the Chief Health, Safety and Security Officer.
- (7) DOE-approved dose coefficients must be used to evaluate doses resulting from DOE radiological activities. Use of alternative dose coefficients must be approved by the Chief Health, Safety and Security Officer or by a Cognizant Secretarial Officer in consultation with the Chief Health, Safety and Security Officer.

Doses to members of the public from airborne effluents must be evaluated with the CAP-88 model or another EPA-approved model or method to demonstrate compliance with applicable subparts of 40 CFR Part 61, *National Emission Standards for Hazardous Air Pollutants*.

- f. Airborne Radioactive Effluents. Radiological activities must be conducted in a manner such that the release of radioactive material to the atmosphere will:
- (1) Be evaluated using the ALARA process established in paragraph 4.d(2) of this Order;
 - (2) Not cause radon-222 flux rates to exceed $20 \text{ pCi (0.7 Bq) m}^{-2} \text{ sec}^{-1}$ averaged over the surface area overlaying waste, including the covering or other confinement structures, wherever radium-226 wastes are accepted for storage or disposal (See 40 CFR Part 61, Subparts Q and T);
 - (3) Meet compliance agreements under 40 CFR Part 61, Subparts H, Q, and T;
 - (4) Not cause the radon-220 and radon-222 decay product concentration, including background, to exceed 0.03 WL in buildings that can be occupied. Further, a reasonable effort must be made to meet a 0.02WL generic guideline for annual average radon-220 and radon-222 decay product concentration, including background, in such buildings; and

- (5) Not exceed 3 pCi/L annual average radon-220 and radon-222 concentration, not including background, at the site boundary if DOE activities release radon-220 and radon-222 or their decay products.
- g. Control and Management of Radionuclides from DOE Activities in Liquid Discharges. Operators of DOE facilities discharging or releasing liquids containing radionuclides from DOE activities must:
- (1) Characterize planned and unplanned releases of liquids containing radionuclides from DOE activities, consistent with the potential for on- and off-site impacts, and provide an assessment of radiological consequences as necessary to demonstrate compliance with the requirements of this Order.
 - (2) Comply with the ALARA process requirements in paragraphs 4.d(2) and (3) of this Order.
 - (3) Conduct activities to ensure that liquid releases containing radionuclides from DOE activities are managed in a manner that protects ground water resources now and in the future, based on use and value considerations.
 - (4) Conduct activities to ensure that liquid releases containing radionuclides from DOE activities to natural waterways do not exceed either of the following:
 - (a) 5 pCi (0.2 Bq) per gram above background of settleable solids for alpha-emitting radionuclides.
 - (b) 50 pCi (2 Bq) per gram above background of settleable solids for beta-emitting radionuclides.
 - (5) Except for tritium and sanitary sewers, apply Best Available Technology (BAT) at the point of discharge if:
 - (a) The annual average concentration of a given radionuclide is greater than the DOE-approved DCG value for water, or for multiple radionuclides, the composite DCG must be the sum of the fractional DCG values derived from DOE-approved DCG values,
 - (b) The discharge contributes greater than 10 mrem (0.1 mSv) annual TED to members of the public, or
 - (c) The collective dose from all DOE sources is greater than 100 person-rem (1 person-Sv) and the liquid discharge contributes 50 percent or more of this collective dose.
 - (6) Control releases of tritium in a manner that has been established by application of the ALARA process.

- (7) Conduct radiological activities to ensure that radionuclides from DOE activities contained in liquid effluents do not cause private or public drinking water systems to exceed the drinking water maximum contamination limits in 40 CFR Part 141, *National Primary Drinking Water Regulations*.
- (8) Control discharges into sanitary sewers in accordance with the following requirements:
 - (a) Except for excreta from patients treated with radioactive material, discharges of liquids containing radionuclides from DOE activities into non-Federally owned sanitary sewers are prohibited unless:
 - 1 The material is readily soluble (or readily dispersed biological materials) in water;
 - 2 Such discharges comply with ALARA process requirements;
 - 3 BAT is applied to discharges of liquid releases containing radionuclides from DOE activities if the average monthly concentration level at the point of discharge into the sanitary sewer is greater than five times the DOE-approved DCG values for ingestion;
 - 4 Releases do not result in an annual discharge (above background) into sanitary sewers in excess of 5 Ci (185 GBq) of tritium; 1 Ci (37 GBq) carbon-14 or 1 Ci (37 GBq) of all other radionuclides combined;
 - 5 DOE operations are conducted to minimize long-term buildup of radionuclides in the sewage treatment plants that may create handling and disposal issues or interfere with plant operations;
 - 6 Operators of sewage treatment plants are informed of DOE practices and processes to radiologically control and clear discharges, and are notified of unusual discharges to sanitary sewers;
 - 7 The DOE Field Element Manager provides a report that describes and summarizes such discharges to sanitary sewers to appropriate local officials at least annually; and
 - 8 Existing agreements, contracts, statements of understanding or other formal arrangements with other agencies concerning the discharge of liquids containing

radionuclides from DOE activities to sanitary sewers are not violated.

- (b) DOE facilities discharging liquids containing radionuclides from DOE activities into sanitary sewer systems owned by the Federal government are not subject to the requirements in paragraph 4.g(8)(a) of this Order if:

- 1 The system provides treatment in accordance with an approved ERPP and
- 2 Sludge from the system is disposed of in accordance with this Order and applicable Federal, State, and municipal regulations.

- (9) Prohibit the use of soil columns.
- (10) Manage the disposition of non-process water potentially containing radionuclides from DOE activities to protect soil and ground water and prevent the creation of future cleanup sites.
- (11) Ensure that storm water runoff containing radionuclides from DOE activities meets the requirements of paragraph 4.g of this Order. Additionally, the receiving ecosystem including, but not limited to, wetlands, floodplains, streams, ponds, basins and lakes must be monitored to evaluate human or ecological impacts.

h. Radioactive Waste and Spent Nuclear Fuel.

(1) Management, Storage and Disposal of Radioactive Waste.

- (a) Radiological activities must be conducted in a manner such that radiation exposure to members of the public from radioactive waste complies with ALARA process requirements and does not result in a TED greater than 25 mrem (0.25 mSv) in a year from all exposure pathways and radiation sources associated with the waste, except radon and its decay products.
- (b) DOE management of spent nuclear fuel, and high-level and transuranic wastes at a disposal facility which is not regulated by the NRC must comply with the requirements of this Order and 40 CFR Part 191, *Environmental Radiation Protection Standards for Management and Disposal of Spent Nuclear Fuel, High-level and Transuranic Radioactive Wastes*. The management of high-level and transuranic wastes at DOE facilities that are not licensed by NRC must comply with the requirements of DOE O 435.1, *Radioactive Waste Management*, dated 7-9-99, and DOE

M 435.1-1, *Radioactive Waste Management Manual*, dated 7-9-99, and may use the guidance in DOE M 435.1-1 and DOE G 435.1-1, *Implementation Guide for Use with DOE M 435.1*, dated 7-9-99.

- (c) Management and disposal of low-level radioactive waste must be conducted in a manner such that exposure to members of the public to radiation from radioactive waste complies with ALARA process requirements, and does not exceed a TED of 25 mrem (0.25 mSv) in a year from all exposure pathways and radiation sources associated with the waste, except radon and its decay products. Management, storage, and disposal of low-level radioactive waste must comply with the requirements in DOE O 435.1 and DOE M 435.1.
- (d) Management and disposal of byproduct material, as defined in Section 11e.(2) of the AEA and other wastes containing uranium and thorium and their decay products which are not subject to the requirements of 40 CFR Part 192, *Health and Environmental Protection Standards for Uranium and Thorium Mill Tailings*, are not at facilities licensed by the Nuclear Regulatory Commission, or are not disposed of at DOE low-level waste disposal facilities must be in accordance with the requirements of paragraph 4.h(1) of this Order and DOE-approved plans.
 - 1 Disposal facilities for uranium and thorium wastes must be designed to:
 - a Remain effective for one thousand years, to the extent reasonably achievable, and, in any case, for at least 200 years and
 - b Provide reasonable assurance that releases of radon-222 to the atmosphere will not: (1) exceed an average release rate of 20 picocuries per square meter per second or (2) increase the annual average concentration of radon-222 in air at or above any location outside the disposal site by more than one-half picocurie per liter.
 - 2 For wastes containing significant concentrations of radium and thorium, special considerations must be given to intruder prevention.
 - 3 Before any potentially biodegradable contaminated wastes are placed in a disposal facility, such wastes must be conditioned so that the generation and escape of biogenic gases will not cause the emission or dose limits in

paragraph 4.h(1) of this Order to be exceeded and that biodegradation within the facility will not result in premature structural failure.

4 All plans for the management and disposal of these wastes must be consistent with DOE P 454.1 and in accordance with DOE O 430.1 in regards to institutional controls and long-term stewardship of the disposal facility.

(e) 11e.(3) and 11e.(4) Byproduct Material. Discrete sources of radium-226, accelerator produced material, or naturally-occurring radioactive material (NORM) that pose a threat similar to discrete sources of radium-226, which are defined as 11e.(3) or 11e.(4) byproduct material in the AEA, must be managed as high-level waste, low-level waste or 11e.(2) material as appropriate under DOE AEA authorities and in compliance with the requirements of this Order and DOE O 435.1.

i. Protection of Drinking Water. DOE sites must provide a level of radiation protection for persons consuming water from a drinking water system operated by DOE, directly or through a DOE contractor, which is equivalent to that provided to members of the public by the community drinking water standards of 40 CFR Part 141, *National Primary Drinking Water Regulations*.

j. Protection of Biota.

(1) Radiological activities that have the potential to impact the environment must be conducted in a manner that protects populations of aquatic animals, terrestrial plants, and terrestrial animals in local ecosystems from adverse effects due to radiation and radioactive material released from DOE operations.

(2) Radiological activities that cause direct radiation of the environment, or that discharge or otherwise release radioactive material into the environment must demonstrate compliance with paragraph 4.j(1) of this Order in one of the following ways:

(a) Use DOE-STD-1153-2002, *A Graded Approach for Evaluating Radiation Doses to Aquatic and Terrestrial Biota* to demonstrate that the dose rates to representative biota populations do not exceed the dose rate criteria in paragraph 4.j(3) of this Order.

(b) Use a DOE-approved alternative approach to demonstrate that the dose rates to representative biota populations do not exceed the dose rate criteria in paragraph 4.j(3) of this Order.

- (c) Conduct an ecological risk assessment, using DOE-approved procedures to demonstrate that radiation and radioactive material released from DOE operations will not adversely affect populations within the ecosystem.

(3) Dose Rate Criteria

Table 1. Protection of Biota Criteria*

Biota Criteria	Absorbed Dose Rate (rad/day)	Absorbed Dose Rate (mGy/day)
Aquatic Animals	1	10
Terrestrial Plants	1	10
Terrestrial Animals	0.1	1

* See DOE-STD-1153-2002 for basis of biota dose rate criteria

- k. Clearance of Property. Clearance of all property with the potential to contain residual radioactive material must be conducted in accordance with the requirements in paragraph 4.k of this Order.³
- (1) Property control and clearance processes must be developed and implemented in accordance with the dose limits in paragraph 4.b under any plausible use of the property and the ALARA process requirements in paragraph 4.d of this Order are met before property is cleared.
- (2) Dose Constraints. Unless alternative dose constraints are approved by issuance of a directive or memorandum by the Chief Health, Safety and Security Officer, or for NNSA, the Cognizant Secretarial Officer in consultation with the Chief Health, Safety and Security Officer the following dose constraints for DOE residual radioactive material must be applied to each specific clearance of property for any actual or likely future use of the property:
- (a) Real property – a TED of 25 mrem (0.25 mSv) above background in any calendar year;
- (b) Personal property - a TED of 1 mrem (0.01 mSv) above background in any calendar year.
- (3) Residual Radioactive Material. Property potentially containing residual radioactive material must not be cleared from DOE control unless either:

³ In addition to Section 4.k of this Order, the following DOE property control requirements may have applicable requirements regarding clearance of property: 41 CFR Chapter 109, *Department of Energy Property Management Regulations*; 10 CFR Part 770, *Transfer of Real Property at Defense Nuclear Facilities for Economic Development*; DOE O 430.1B, *Real Property Asset Management*; DOE O 580.1, *Department of Energy Personal Property Management Program*.

- (a) The property is demonstrated not to contain residual radioactive material based on process and historical knowledge, radiological monitoring or surveys, or a combination of these; or
- (b) The property is evaluated and appropriately monitored or surveyed to determine:
 - 1 The types and quantities of residual radioactive material within the property;
 - 2 The quantities of removable and total residual radioactive material on property surfaces (including residual radioactive material present on and under any coating);
 - 3 That for property with potentially contaminated surfaces that are difficult to access for radiological monitoring or surveys, an evaluation of residual radioactive material on such surfaces is performed which is:
 - a Based on process and historical knowledge meeting the requirements of paragraph 4.k(5) of this Order and monitoring and or surveys, to the extent feasible and
 - b Sufficient to demonstrate that applicable specific or pre-approved DOE Authorized Limits will not be exceeded; and
 - 4 That any residual radioactive material within or on the property is in compliance with applicable specific or pre-approved DOE Authorized Limits.
- (4) Evaluation of the Need of Real Property for Maintaining Institutional Controls. Real property under evaluation for clearance from DOE radiological controls must be evaluated against its need for maintaining institutional controls or impacting long-term stewardship of adjacent DOE real property. In situations where transfer of the real property to other use would impact long-term radiological protection of adjacent DOE properties, it must be demonstrated that the impact of the property clearance would not result in noncompliance for the adjacent property with the requirements of this Order, DOE O 435.1, or other applicable statutes, regulations or orders.
- (5) Process and Historical Knowledge. Organizations responsible for radiological clearance of property must establish an evaluation process for applying process and historical knowledge to determine if property potentially contains residual radioactive material.

- (a) This process must include procedures for evaluating operational records, operating history, and process knowledge including use of any radioactive materials or radiation generating devices.
 - (b) For real property, this process must address each specific property individually. If several parcels of land are contiguous, or if several structures are located in the same area and have a common operational history, a single evaluation for all of the properties is acceptable.
 - (c) For personal property, a single evaluation for properties with a common use, location, or process knowledge may be used.
 - (d) If available process and historical knowledge cannot demonstrate that property does not contain residual radioactive materials, radiological monitoring or surveys must be conducted to supplement process and historical knowledge evaluations.
 - (e) Process and historical knowledge evaluations must be adequate to determine:
 - 1 Whether the property has ever been used for radiological activities or in areas that could have resulted in the presence of residual radioactive material within or on the property or
 - 2 Whether property formerly containing residual radioactive material has been decontaminated and demonstrated to meet DOE Authorized Limits, and has not been used in a manner or in areas that could have resulted in the re-contamination of the property.
 - (f) For property that is determined to potentially contain residual radioactive material under paragraph 4.k(5)(e)1, or determined to be re-contaminated under paragraph 4.k(5)(e)2, the process and historical knowledge evaluation must also include an assessment of the types and quantities of residual radioactive material and the sources and pathways by which the property became contaminated.
 - (g) Process and historical knowledge evaluation procedures must be described in the ERPP documentation.
- (6) Authorized Limits.
- (a) Authorized Limits must be established and approved for the clearance of any property with potential to contain residual

radioactive material to provide reasonable assurance that the requirements of paragraphs 4.k(1) and 4.k(2) are met.

(b) Authorized Limits must:

- 1 Be developed in accordance with the ALARA requirements in paragraph 4.d of this Order;
- 2 Be based on the applicable dose constraint, supported by a complete exposure pathway analysis using methodologies, techniques, and parameters approved by a Cognizant Secretarial Officer in consultation with the Chief Health, Safety and Security Officer;
- 3 Be expressed in terms of concentration of radioactivity per unit surface area (e.g., dpm per 100 cm²) or per unit mass or volume (e.g., pCi per gram), or total radioactivity, or DOE controls and restrictions, if applicable;
- 4 Explicitly state any restrictions or conditions on future use of the property necessary to ensure the basic dose limit and applicable dose constraint are not exceeded;
- 5 Include written notification of applicable Federal, State, or local regulatory agencies, or Tribal governments;
- 6 Be approved in accordance with paragraph 4.k(6)(e); and
- 7 In addition to paragraphs 4.k(6)(c)1-6, for clearance of personal property only:
 - a Be based on expected annual quantity of property to be cleared or
 - b Be based on expected total amount of property cleared over the life of the project for specific remedial action or decontamination and decommissioning projects and
 - c Prior to clearance of metals, the Field Element Manager must determine that there is no practical internal DOE opportunity for reuse or recycle of the material or equipment.

(c) Applications for DOE approval of Authorized Limits must contain the following:

- 1 A description of the property.

- 2 Specific limits proposed for each radionuclide or group of radionuclides and/or external radiation exposure, surrogate metrics, or conditions used to limit radionuclides.
 - 3 Potential collective dose to the exposed population and the potential dose to a member of the public most likely to receive the highest dose for both: actual or likely future use, and plausible future use of the property.
 - 4 ALARA assessments conducted under paragraph 4.d of this Order for the proposed clearance action to include, at a minimum, the effects of:
 - a Implementing the proposed Authorized Limits;
 - b Implementing levels of residual radioactive material other than the proposed Authorized Limits;
 - c Not implementing the proposed Authorized Limits, i.e., not proceeding with the proposed clearance action.
 - 5 A description of the procedures and radiological monitoring or surveys to be used to demonstrate compliance with proposed limits.
 - 6 Identification of any restrictions or conditions on the future use of the property upon which the proposed limits are based, and the means by which the restrictions or conditions will be implemented and maintained.
 - 7 Evidence of notification of applicable Federal, State or local regulatory agencies or Tribal governments.
 - 8 An estimated date for when the property will be cleared and an estimate of when the property will be released from DOE control.⁴
- (d) DOE Approval of Authorized Limits.
- 1 All Authorized Limits must be approved in writing. Authorized Limits for real property require Field Element Manager approval in consultation with the Cognizant

⁴ This information is needed to support the DOE expectation stated at 72 FR 31906 (10 CFR Part 835, June 8, 2007) that the material, equipment, or real property to which the 10 CFR Part 835.1(b)(6) exclusion is applied will be released from DOE control according to a specified time interval.

Secretarial Officer and in consultation with the Chief Health, Safety and Security Officer.

2 Authorized Limits for personal property generally require approval by the Cognizant Secretarial Officer in consultation with the Chief Health, Safety and Security Officer. However, the responsible Field Element Manager can approve Authorized Limits for personal property (including any restrictions or conditions on future use of the personal property) if the following conditions are met:

- a Clearance of the property must not cause a TED to a member of the public in excess of 1 mrem (0.01 mSv) in any year or a public collective dose of more than 10 person-rem (0.1 person-Sv) in any year due to residual radioactive material for any actual or likely future use of the property;
- b Documentation supporting the Authorized Limits is provided to the responsible Cognizant Secretarial Officer and the Chief Health, Safety and Security Officer at least 45 working days prior to the intended implementation date of the Authorized Limits; and
- c The Cognizant Secretarial Officer or the Chief Health, Safety and Security Officer does not notify the Field Element Manager within 30 working days of receipt of application that the documentation is incomplete or that the Authorized Limits are not acceptable.

3 Authorized Limits for property that has not been released from DOE control must meet the criteria in paragraphs 4.k(6)(a) through (d) of this Order and be approved by a Cognizant Secretarial Officer in consultation with the Chief Health, Safety and Security Officer if such property is to be excluded from the provisions of 10 CFR Part 835.

- (e) Revision of Authorized Limits. If established Authorized Limits are found to be not protective, appropriate or practical to apply for a specific type or portion of property, further clearance for that specific type or portion of property must not proceed without revised Authorized Limits.

- 1 An application for revised Authorized Limits must be submitted in accordance with the requirements in paragraphs 4.k(6)(a) through (d) of this Order.
- 2 Approval of revised Authorized Limits must be provided in accordance with the requirements in paragraph 4.k(6)(e) of this Order.
- 3 In addition to the requirements of applicable paragraphs of 4.k(6) of this Order, requests for approval of revised Authorized Limits must include a justification for the need for the revised Authorized Limits. Justifications for revised Authorized Limits must be based upon one of the following:
 - a Complying with existing Authorized Limits would pose a clear and present risk of injury to general employees or members of the public; or
 - b Complying with existing Authorized Limits would produce environmental harm (e.g., destruction of artifacts, ecological damage, loss of cultural assets) that is clearly excessive compared to the potential health benefits to persons exposed to affected properties; or
 - c Complying with existing Authorized Limits is unreasonably costly relative to long-term benefits and where the residual radioactive material does not pose a clear present or future potential of exceeding the public dose limit of paragraph 4.b(1) of this Order;
 - d Portions of the project or activity for which the scenarios or assumptions used to establish the existing Authorized Limits are overly conservative, or where more appropriate scenarios or assumptions indicate that other limits are applicable or appropriate for protection of the public and the environment; or
 - e New information which indicates the existing Authorized Limits are not sufficient to meet the protective requirements of this Order.

(f) Pre-Approved Authorized Limits.

- 1 The following values have been pre-approved by DOE for use as Authorized Limits, and may be used instead of developing and approving specific Authorized Limits if the responsible Field Element Manager approves their use:
 - a For radium-226 and radium-228 in soil - 5 pCi/gram (0.2 Bq/gram) in excess of background levels, averaged over 100 m², in the first 15 cm depth of the surface layer of soil; and 15 pCi/gram (0.56 Bq/gram) in excess of background levels, averaged over any subsequent 15 cm subsurface layer of soil plus an ALARA assessment. If both thorium-230 and radium-226 or both thorium-232 and radium-228 are present and not in secular equilibrium, the appropriate pre-approved limit must be applied to the radionuclide with the higher concentration.
 - b Guidelines and limits previously derived from DOE Order 5400.5 and associated guidance (such as the surface activity guidelines) may continue to be applied and used as Pre-Approved Authorized Limits until they are replaced or revised by Pre-Approved Authorized Limits issued under this Order.
- 2 Other Pre-Approved Authorized Limits must be approved by the Chief Health, Safety and Security Officer or the responsible Cognizant Secretarial Officer in consultation with the Chief Health, Safety and Security Officer.
 - a The approvals may be made through a DOE memorandum but must be included in a DOE directive issued under DOE O 251.1C or a Technical Standard under DOE O 252.1 within eighteen months of issuance.
 - b Pre-Approved Authorized Limits must provide reasonable expectation that their implementation will comply with the requirements in paragraphs 4.k(1) and 4.k(2) of this Order.
 - c The scope of applicability (e.g., property, activities, or radionuclides) and conditions of, or restrictions on, their use must be documented.

- 3 Pre-Approved Authorized Limits may be used for any radiological activity instead of developing specific Authorized Limits if their use is documented in the ERPP and approved by the responsible Field Element Manager.
- (g) Documentation of Approved Authorized Limits. Approved Authorized Limits and approved revised Authorized Limits and supporting documentation must be made available to the public.
- (7) Clearance of Environmental Restoration, Decommissioning and Other Cleanup Materials.
 - (a) Clearance of property with residual radioactive material from environmental restoration activities, including decommissioning, must meet the requirements of this Order. Environmental restoration activities using the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) process (in accordance with Executive Order 12580) may demonstrate compliance with the requirements of this Order (including general employee and public dose assessments, ALARA analysis, and consideration of scenarios) through the CERCLA process.
 - (b) For the purpose of clearance of real or personal property, approved CERCLA remediation criteria may be considered equivalent to Authorized Limits if the appropriate Field Element Manager has determined that the criteria meet the requirements in this Order for Authorized Limits, and provided that the use of the criteria as DOE Authorized Limits is documented and approved as would be an Authorized Limit. Compliance with all requirements of this Order not met through the CERCLA process must also be demonstrated.
 - (c) Field Elements performing environmental restoration activities involving clearance of real or personal property with residual radioactive material under the CERCLA process that use the CERCLA analysis and documentation in lieu of DOE O 458.1-specific analysis and documentation to demonstrate compliance with this Order must:
 - 1 Submit certification to a Cognizant Secretarial Officer that compliance with the requirements of this Order for clearance of property has been met through application of the CERCLA process and
 - 2 Submit the decision document, such as the Record of Decision, or any other document that serves as authorization for the clearance action, and any additional information necessary to demonstrate that the CERCLA

remediation criteria meet the requirements for Authorized Limits, to a Cognizant Secretarial Officer and provide a copy of the decision document to the Chief Health, Safety and Security Officer.

(8) Radiological Monitoring or Surveys.

(a) All radiological monitoring or surveys performed in support of clearance of property must:

- 1 Use methodologies that have been approved for clearance of property by either a Cognizant Secretarial Officer or the Chief Health, Safety and Security Officer;
- 2 Meet Measurement Quality Objectives approved by a Cognizant Secretarial Officer;
- 3 Use DOE-approved sampling and analysis techniques, if applicable; and
- 4 Include an evaluation of non-uniformly distributed residual radioactive material, if applicable.

(b) Instrumentation used for radiological monitoring or surveys must be capable of detecting and quantifying residual radioactive material consistent with the applicable Authorized Limits, and be:

- 1 Periodically maintained and calibrated on an established frequency;
- 2 Appropriate for the type(s), levels, and energies of the radiation(s) encountered; and
- 3 Appropriate for existing environmental conditions; and routinely tested for operability.

(9) Documentation and Verification.

(a) DOE elements responsible for radiological clearance of property must ensure that final radiological monitoring or surveys are conducted and that documentation is prepared that shows that the clearance meets applicable DOE Authorized Limits, or other applicable requirements. The need for and plans to implement any necessary restrictions or institutional controls consistent with DOE P 454.1 are a necessary part of the documentation.

- (b) All DOE field elements conducting radiological clearance of property must establish independent verification (IV) programs to verify that the radiological clearance requirements of this Order, or other applicable radiological clearance requirements, have been met. Such IV programs apply to all radiological clearance activities conducted by or for line DOE elements, but do not apply to DOE organizations strictly conducting quality assurance, contractor oversight, independent assessment, or regulatory functions, unless those organizations also clear property as part of their programs. IV provides confidence to DOE that property actually cleared from radiological controls does, in fact, meet the radiological clearance requirements of this Order, or other applicable radiological clearance requirements. Field element IV programs must be developed in coordination with a Cognizant Secretarial Officer.

- 1 IV for radiological clearance of property must include a review of the adequacy of radiological monitoring and surveys instrumentation, radiological survey procedures, recordkeeping, methodologies, and techniques used for the clearance of such property. IV may also include independent radiological measurements, radiological sampling, and analyses of samples. A graded approach must be applied to the level and scope of the IV effort.
- 2 IV must be conducted for the clearance of all real property in a graded manner, commensurate with the risk and complexity of the project. For real property being cleared for unrestricted or designated use, IV must include radiological monitoring or surveys, where appropriate.
- 3 IV must be conducted for the processes and programs for clearance of personal property.
- 4 Personnel performing IV must be independent of the operating contractor responsible for the clearance. Personnel or organizations performing IV activities must:
 - a Report directly to DOE,
 - b Have sufficient authority and freedom from DOE line management to perform independent verification of radiological clearance activities, and
 - c Possess appropriate technical qualifications and knowledge of radiological monitoring and surveys and radiological clearance.

- (10) Public Notification of Clearance of Property.
 - (a) Field Element Managers must, as appropriate, incorporate information on site clearance policies and protocols, process knowledge decisions, approved Authorized Limits, any approved revised Authorized Limits, use of pre-approved Authorized Limits, and property control and clearance programs into effective site public notification and communications programs.
 - (b) Information on approved Authorized Limits, any approved revised Authorized Limits, use of pre-approved Authorized Limits, results of radiological monitoring and surveys of cleared property with type and quantity of property cleared, and IV program results must be summarized in the Annual Site Environmental Report.
 - (c) Each responsible field element must make documentation on clearance of property available to the public and to the property owner or recipient as appropriate.
- (11) Final Clearance Documentation. Clearance of property must be documented. The contents of the documentation or the mechanism for documenting information may be tailored to the need, situation, and type of property being cleared. For ongoing, routine clearances, e.g., clearance of individual and personal property from controlled areas, such documentation may be based on the general process(es) rather than each specific clearance. In general, the documentation must describe the clearance process(es) and the property being cleared.
 - (a) The documentation must indicate any Authorized Limits, including any revised or pre-approved Authorized Limits used for the clearance, and include information and data supporting the clearance of property such as radiological certification and IV program results including:
 - 1 Introduction (describe the clearance scenario, concisely explaining why the property was eligible for radiological clearance);
 - 2 Description of the property;
 - 3 Radiological history of the property;
 - 4 Remedial action history of the property;
 - 5 Final radiological conditions;
 - 6 Description of any dose assessment(s) for the property which:

- a Identifies the clearance criteria for the property,
 - b Describes the bases for the criteria,
 - c Documents DOE's approval of the clearance criteria, and documents that the clearance criteria are consistent with applicable State and Federal requirements;
 - 7 Identification of any restrictions on use or disposition of the property and the specific process or means that provide a reasonable expectation that the restrictions or controls will be implemented;
 - 8 Description of any radiological monitoring or surveys of the property to include the date(s) of the monitoring or surveys, the identity of the surveyor(s), the types and identification numbers of the instruments used, and the results of the monitoring or surveys;
 - 9 ALARA analysis demonstrating that further remediation or decontamination is not warranted;
 - 10 The identity of the recipient of the property, the property destination, or the property's disposition, as appropriate;
 - 11 Summary and Conclusions;
 - 12 References (if applicable); and
 - 13 Attachments (if applicable).
 - (b) Field Element Managers or their designees must ensure in the preparation and maintenance of documentation that property being sold or otherwise cleared from DOE radiological control:
 - 1 Meets all DOE radiological protection requirements,
 - 2 Is not required to be controlled for national security reasons, and
 - 3 Meets DOE property control requirements.
1. Records, Retention and Reporting Requirements.
- (1) Records must be maintained to document compliance with the requirements of this Order.

(2) Required records include the following:

- (a) Information and data necessary to identify and characterize releases of radioactive material to the environment, their fate in the environment, and their probable impact on radiation dose to members of the public, and any impacts on ecological systems.
- (b) Documentation of individual and collective dose to members of the public due to radiological activities. This includes documentation of site-specific information on radiation source dispersion patterns, location and demography of members of the public in the vicinity of the radiological activity and assumed default values or site-specific parameters used in calculations.
- (c) Requests for specific authorization for temporary public dose limits, and subsequent approvals and other related actions.
- (d) Identification of existing or anticipated radiological activities subject to ERPP requirements, and descriptions of the measures to be used in implementing these ERPP requirements.
- (e) Documentation of actions taken to implement the ALARA process identified in paragraph 4.d of this Order.
- (f) Documentation of actions taken to demonstrate compliance with the public dose limit [See paragraph 4.e(1) of this Order].
- (g) Documentation of actions taken to implement the BAT selection process in regulating liquid discharges, including documentation of analyses and factors considered to be important, including alternative processes, for the BAT selection process.
- (h) Effluent monitoring and environmental surveillance information and data, including:
 - 1 Results of effluent monitoring for determining sources of radiation and radioactive material that provide direct exposure to members of the public and releases of radioactive material in liquid or airborne effluent,
 - 2 Results of surveys for radiation and radioactive material in the environment,
 - 3 Results of surveys, measurements, and calculations used to determine the dose to members of the public and ecological receptors from external and internal radiation sources,
 - 4 Meteorological data used in assessing dose, and

5 Results of pre-operational monitoring.

- (i) Documentation related to the long-term management of radioactive waste and residual radioactive material.
- (j) Final documentation for clearance of property containing residual radioactive material.
- (k) Documentation of:
 - 1 Approved Authorized Limits for routine clearance of property for unrestricted or restricted use and the scenarios evaluated in selecting the limits,
 - 2 Approved revised Authorized Limits for clearance of property, and
 - 3 Written notification of applicable Federal, State or local regulatory agencies or Tribal governments (See paragraph 4.k(6) (c) 7 of this Order).
- (l) Annual summaries related to clearance of property submitted to the site's landlord program office.
- (3) Records required by this Order must be maintained by, or transferred to, DOE upon cessation of a DOE radiological activity at a site.
- (4) Unless otherwise specified in this Order, records must be retained until final disposition is authorized by DOE in accordance with DOE O 243.1, *Records Management Program*, dated 2-3-06.
- (5) Reporting.
 - (a) Reporting requirements for this Order are contained in DOE M 231.1-2, *Occurrence Reporting and Processing of Operations Information*, dated 8-19-03, and DOE M 231.1-1A, *Environment, Safety and Health Reporting Manual*, dated 3-19-04.
 - (b) The responsible Field Element Manager must notify a Cognizant Secretarial Officer and the Chief Health, Safety and Security Officer within 30 calendar days when it has been identified that any requirement specified in this Order not required to be reported under paragraph 4.l(5)(a) has not been met.
- (6) Units. Unless otherwise specified, the quantities used in the reports and records required by this Order must be clearly indicated in special units of curie, rad, roentgen, or rem, including multiples and subdivisions of these units, or other conventional units, such as dpm, dpm/100 cm², or mass

units. The SI units, and becquerel (Bq), gray (GY), and sievert (Sv) may be provided parenthetically for reference with scientific standards.

5. RESPONSIBILITIES.

a. Cognizant Secretarial Officers.

- (1) Ensure that the requirements of this Order are implemented throughout organizations under their purview.
- (2) Request through the annual Department budgetary process the funding and resources needed to implement the requirements of this Order.
- (3) Coordinate on the development of Field Element independent verification programs.
- (4) Ensure that an oversight program is in effect to identify and correct deficiencies in the programs for the radiological protection of the public and the environment.
- (5) Serve as the approval authority for the following:
 - (a) Initial and updated ERPP Plans which include:
 - 1 Ecological risk assessment procedures and approaches for demonstrating protection of populations of aquatic animals and terrestrial plants and animals in local ecosystems,
 - 2 Measurement quality objectives for radiological monitoring or surveys, and
 - 3 Methodologies for clearance of property.
 - (b) Authorized Limits in accordance with paragraphs 4.k(6)(b) and (d) of this Order.
 - (c) Temporary Dose Limits in accordance with paragraphs 4.c(2) and (3) of this Order.
- (6) Serve as an approval authority for methodologies for clearance of property.
- (7) Approve methodologies, techniques, and parameters used to develop Authorized Limits in consultation with the Chief Health, Safety and Security Officer.
- (8) Approve Authorized Limits for clearance of property in accordance with the requirements of this Order.

- (9) Notify a field organization if the requested Authorized Limit, revised Authorized Limit, or supporting materials are incomplete or not acceptable within 30 working days of receipt of a submitted application.
- (10) Document and maintain current delegations in their Offices' safety management functions, responsibilities, and authorities (FRA) documentation consistent with DOE M 411.1-1C, *Safety Management Functions, Responsibilities, and Authorities Manual*, dated 11-23-03.

b. Field Element Managers.

- (1) Implement the requirements in this Order for radiological activities under their purview. Such implementation must include, but may not be limited to ensuring that:
 - (a) Documented Environmental Radiological Protection Programs (ERPPs) are established,
 - (b) Sufficient oversight is conducted to ensure compliance with the requirements in this Order, and
 - (c) All records, reports, and documentation required by this Order are prepared, issued, and/or retained in accordance with applicable requirements.
- (2) Approve applicable Authorized Limits for clearance of property in accordance with the requirements of this Order.
- (3) Ensure that sites' annual budget requests include the funding and resources needed to implement the requirements of this Order.
- (4) Ensure that all personnel whose actions are affected by this Order receive awareness training in the applicable ERPP Plans, including environmental ALARA principles and processes for all radiological activities that could affect the radiological dose to members of the public or potentially result in radiological releases to the environment.
- (5) Ensure that appropriate capabilities are maintained for monitoring and assessing routine and unplanned releases of radioactive materials, consistent with the types of radioactive materials released, release modes, and radiological activities conducted.
- (6) Ensure that agreements, permits, leases, licenses, or other legally-binding obligations between DOE and a tenant or concessionaire entered into after the effective date of this Order, require that the tenant or concessionaire take actions relating to matters within the scope of the contract that facilitate DOE's compliance with this Order.

- (7) Temporarily suspend any requirement of this Order when doing so is in their judgment necessary to minimize damage to life or property or to protect public health or safety. Whenever this provision is invoked, such suspension and the reason for it are to be reported to a Cognizant Secretarial Officer and to the Chief Health, Safety and Security Officer at the earliest practicable time.

c. Chief Health, Safety and Security Officer.

- (1) Develops new, or revises existing DOE directives, policies, guidance, standards, requirements and procedures related to this Order and CRD, and provides assistance on implementation issues.
- (2) Plans and conducts appraisals to determine compliance with requirements of this Order. (See DOE O 470.2B, *Independent Oversight and Performance Assurance Program*, dated 10-31-02.)
- (3) Evaluates the effectiveness of Departmental elements' implementation of the requirements and responsibilities of this Order.
- (4) Provides consultation to Cognizant Secretarial Officers on approval decisions related to the following:
 - (a) Requests for specific authorizations for a temporary public dose limit and
 - (b) Authorized Limits for real and personal property, and property excluded from the provisions of 10 CFR Part 835.
- (5) Approves or provides consultation to Cognizant Secretarial Officers' approval decisions on the following:
 - (a) The use of alternative dose coefficients,
 - (b) Alternative dose constraints for DOE residual radioactive material, and
 - (c) Pre-Approved Authorized Limits.
- (6) Approves or provides concurrence in Field Element Managers' approval of alternative dose evaluation models.
- (7) Notifies responsible Field Element Managers within 30 days of receipt of an Authorized Limit application if the supporting documentation is incomplete, or if the Authorized Limits are not acceptable.

d. Office of the Chief Financial Officer, in coordination with other Departmental elements, ensures that requests for funding by the Department elements

responsible for the development of policies, directives, and programs for maintaining the radiological protection of the public and the environment are considered in the annual budget requests.

- e. Contracting Officers or Representatives. Modify contracts to incorporate the Contractor Requirements Document in Attachment 1.

BY ORDER OF THE SECRETARY OF ENERGY:

DANIEL B. PONEMAN
Deputy Secretary

DRAFT CONTRACTOR REQUIREMENTS DOCUMENT
DOE O 458.1, *RADIATION PROTECTION OF THE PUBLIC AND THE ENVIRONMENT*

The provisions of this Contractor Requirements Document (CRD) apply to all radiological activities conducted by Department of Energy (DOE) and National Nuclear Security Administration (NNSA) contractors.

Regardless of the performer of the work, the contractor is responsible for complying with the requirements of this CRD and flowing down the CRD requirements to subcontractors at any tier to the extent necessary to ensure contractor compliance with the requirements.

1. GENERAL REQUIREMENTS.

- a. The contractor must establish and implement a program to protect the public and the environment against undue risk from radiation associated with DOE radiological activities through application of the Specific Requirements (paragraph 2) in this CRD.
- b. The contractor must develop documentation that demonstrates how the Specific Requirements in this CRD are implemented.
- c. The contractor must obtain DOE line management approval of the documentation demonstrating compliance with the Specific Requirements in this CRD.

2. SPECIFIC REQUIREMENTS.

- a. The contractor conducting radiological activities must develop and implement a documented Environmental Radiological Protection Program (ERPP) and address the following elements:
 - (1) Documentation (ERPP Plan) may include by reference sections or chapters of other documents or materials that are applicable for documenting plans, procedures, and schedules for compliance with the Specific Requirements in this CRD.
 - (2) Radiological activities must be conducted in accordance with the applicable ERPP Plan.
 - (3) ERPP Plan(s) are to be incorporated into the site Environmental Management System (EMS) required under the CRD to DOE O 450.1A, *Environmental Protection Program*, dated 6-4-08, to manage, control, and mitigate the environmental impact of site operations and activities, including radiological activities.
 - (4) Commensurate with the nature of the DOE radiological activities at the site and the risk to the public and the environment, the ERPP must address each Specific Requirement in this CRD and at minimum include the following information:

- (a) Identification of existing or anticipated DOE radiological activities subject to the paragraph 2 of this CRD.
- (b) A listing of plans, procedures, and other documents or means used to implement and demonstrate compliance with the Specific Requirements in this CRD.
- (c) ALARA Program (See paragraph 2.d of this CRD).
- (d) Process and Historical Knowledge Evaluation Process [See paragraph 2k(5) of this CRD].
- (e) Environmental Monitoring

1 Environmental Monitoring must be conducted to characterize releases of radioactive material from radiological activities, estimate the dispersal pattern in the environs, characterize the pathway(s) of exposure to members of the public and estimate the doses to individuals and populations in the vicinity of the site or operation. Radiological monitoring must be integrated with the general environmental and effluent monitoring required as part of the EMS in DOE O 450.1A. Environmental monitoring must include, but is not limited to:

- a Effluent Monitoring. Liquid and gaseous effluent samples must be collected and analyzed or measurements of liquid and gaseous effluents performed to characterize and quantify radiological contaminants and process stream characteristics, assess radiation exposures of members of the public, and demonstrate compliance with applicable standards.
- b Environmental Surveillance. Samples of air, water, soil, foodstuffs, biota, and other media at the site and surrounding environs must be collected and analyzed and external radiation measured to demonstrate compliance with applicable standards, assess the radiation dose to members of the public, and assess effects, if any, on the environment.
- c Meteorological Monitoring. Meteorological monitoring must be commensurate with the level of site radiological activities, the site topographical characteristics, and the distance to critical receptors. The scope must be sufficient to characterize

atmospheric dispersion and model the dose to members of the public from routine and non-routine emissions, over distances commensurate with the magnitude of potential source terms and possible pathways to the atmosphere.

- d Pre-operational Monitoring. Prior to the startup of a new site, facility or process which has potential to expose the public or environment to radiation or radioactive material, the site and surrounding area must be characterized to ensure adequate knowledge of radiological background and the pertinent pathways and parameters for assessing potential human exposures or ecological/natural resource impacts. Data from existing monitoring and surveillance programs and NEPA studies may be summarized or cited to satisfy this requirement. If data from existing programs are not sufficient then data must be collected through a pre-operational study initiated at least one year prior to startup of operations. This information will provide a baseline for future effluent monitoring and environmental surveillance programs.

- 2 Site-specific environmental monitoring criteria must be established to ensure that representative measurements of quantities and concentrations of radiological contaminants are conducted and that the effects from DOE radiological activities on members of the public, environment and natural resources are monitored sufficiently to demonstrate compliance with the Specific Requirements in this CRD.

- 3 Ground Water Protection Program. A Ground Water Protection Program must be developed and implemented to protect ground water from radiological contamination and must be integrated with monitoring necessary to implement ground water protection activities required by DOE O 450.1A, paragraph 4.c(2)(c). This program must:

- a Document the baseline condition of the ground water quantity and quality;
- b Identify and assess the possible sources of, and potential for, radiological contamination;
- c Describe the strategies to control radiological contamination; and

d Describe the monitoring methodologies.

- (f) The ERPP Plan must include, or reference, documentation that details radiological protection plans and procedures to manage, store, and dispose of radioactive waste, including low-level radioactive waste, transuranic radioactive waste, high-level radioactive waste, spent nuclear fuel, byproduct material as defined in Section 11e.(2) of the Atomic Energy Act of 1954, as amended (AEA), accelerator-produced material, or technologically enhanced naturally occurring radioactive material (TENORM).

The waste management section of the ERPP Plan for DOE radiological activities must contain directly, or by reference, plans or procedures (e.g., DOE M 435.1, *Radioactive Waste Management*, dated 7-9-99, plans or procedures) that address the radiological protection of the public and the environment, including:

- 1 Basis for controls to ensure compliance with the Specific Requirements in this CRD and with applicable Federal statutes and regulations;
- 2 Description of the means used to limit public access to waste;
- 3 Description of the interim and long-term strategies for managing waste;
- 4 Description of measures to limit biological intrusion into waste disposal sites;
- 5 Description of administrative safeguards;
- 6 Description of the mechanisms for cooperating with State and local officials; and
- 7 References for the management programs that ensure compliance with requirements related to public dose limits, property clearance, and ground water protection.

- (g) Describe programs and procedures used for the radiological clearance of property.
- (h) Describe programs and procedures for implementing long-term stewardship and institutional controls, as necessary, consistent with DOE P 454.1, *Use of Institutional Controls*, dated 4-9-03, and in accordance with DOE O 430.1B, *Real Property Asset Management*, dated 2-8-08, and DOE O 580.1, *Department of*

Energy Personal Property Management Program, dated 12-5-05, for closed, deactivated, cleared or transferred sites, facilities, processes, or property which have the potential for radiological exposure to the public or the environment.

- (5) The contractor must prepare and submit the initial ERPP Plan in a timely manner to the responsible Field Element Manager for review and concurrence.
 - (6) The contractor must prepare and submit an updated ERPP Plan to the responsible Field Element Manager whenever a modification is made to an ERPP Plan.
 - (7) The contractor must make modifications to the ERPP Plan as directed by the responsible Field Element Manager.
- b. The contractor must establish and implement procedures and practices to address the following elements related to the DOE public dose limit:
- (1) DOE radiological activities, including remedial actions and activities using TENORM, must be conducted so that exposure of members of the public to ionizing radiation will:
 - (a) Not cause a total effective dose (TED)⁵ exceeding 100 mrem (1mSv) in a year, an equivalent dose to the lens of the eye exceeding 1500 mrem (15 mSv) in a year, or an equivalent dose to the skin or extremities exceeding 5000 mrem (50 mSv) in a year, from all sources of ionizing radiation and exposure pathways that could contribute significantly to the total dose excepting:
 - 1 Dose from radon and its decay products in air [Radon is regulated separately e.g., under Title 40 Code of Federal Regulations (CFR) Part 61, Subparts Q and T],
 - 2 Dose received by patients from medical sources of radiation, and by volunteers in medical research programs,
 - 3 Dose from background radiation, and
 - 4 Dose to general employees regulated under 10 CFR Part 835 or NRC license; and

⁵ The dosimetric quantities based on the results of dose evaluations for such specific pathways may be considered equivalent to the comparable ICRP 60 quantities and combined with the results of other dose evaluations required by this CRD for comparison with the DOE public dose limit of 100 mrem (1 mSv) TED per year solely for the purposes of demonstrating compliance with the DOE public dose limit of 100 mrem TED per year, and when required specific pathway dose limits are stated in non-ICRP 60 dosimetric quantities, e.g., effective dose equivalent.

- (b) Comply with ALARA program requirements in paragraph 2.d of this CRD.
 - (2) The public dose limit applies to members of the public:
 - (a) Located off DOE sites and on DOE sites and
 - (b) Exposed to residual radioactive material subsequent to any remedial action or clearance of property.
- c. If special circumstances could affect a DOE radiological activity in such a manner that the potential dose to a member of the public could exceed a TED of 100 mrem (1 mSv) in a year the contractor must submit a request for specific authorization for a temporary public dose limit higher than 100 mrem (1 mSv) in a year to the responsible Field Element Manager. This request must include documentation that justifies the need for the increase, the alternatives considered, and the application of the ALARA process. The specific exposure pathways excepted in paragraphs b(1)(a) 1-4 of the Specific Requirements in this CRD are also excepted for temporary dose limits.
- d. As Low As Reasonably Achievable (ALARA) Requirements. The contractor must establish and implement ALARA programs and practices to address the following elements:
 - (1) ALARA Program.
 - (a) A documented ALARA Program must be established to optimize control and management of releases of radioactive material to the environment, and doses to the general employees and to members of the public (both individual and collective) such that levels are kept as low as is reasonably achievable.
 - (b) A documented ALARA Program must include:
 - 1 Statement of commitment to use the ALARA process;
 - 2 Description of the scope of the ALARA program;
 - 3 Description of the means to be used to implement the ALARA process;
 - 4 Description of the process for documenting ALARA decisions; and
 - 5 Description of training program on implementation of the ALARA process.

- (c) An ALARA Program must take into account the design of new facilities or modification of existing facilities, and must be coordinated with any occupational ALARA Program(s).
 - (d) ALARA goals for optimizing control and management of releases of radioactive material to the environment, and exposure to members of the public, must be established and documented on an annual basis.
- (2) ALARA Process.
- (a) The ALARA process must be applied to the following:
 - 1 The design or modification of facilities, processes, and/or radiological activities that could potentially result in releases of radioactive material to the environment, or exposure to members of the public (both individual and collective).
 - 2 All DOE sources and modes of exposure, and all pathways with the potential to release radioactive materials to the environment, or result in doses to members of the public.
 - (b) Societal, environmental, technical, economic, and public policy factors must be considered and evaluated to the extent necessary and practicable in implementing the ALARA process. Factors to be considered, at a minimum, must include:
 - 1 Maximum dose to members of the public;
 - 2 Collective dose to members of the public;
 - 3 Doses to general employees;
 - 4 Nature and levels of environmental releases;
 - 5 Ecological and other environmental impacts;
 - 6 Applicable alternative processes, such as alternative treatments of discharge streams, facility and process designs or modifications, operating methodologies, or controls;
 - 7 Examination of the differences in cost among alternatives; and
 - 8 Societal, technical, and public policy impacts associated with alternatives.

- (c) A graded approach must be applied to the ALARA process.
- (3) ALARA assessments are applicable to all routine radiological activities. Though not applicable to non-routine radiological events (for example, accidental, unplanned, or inadvertent releases, exposures, or doses), ALARA assessments are applicable to recovery and remediation activities associated with such non-routine events.
- e. The contractor must establish and implement procedures and practices to demonstrate compliance with the public dose limit and to address the following elements:
 - (1) Dose evaluations to demonstrate compliance with the public dose limit in paragraph 2.b(1) of this CRD and assess collective dose must include the following:
 - (a) Dose to members of the public from direct exposure to radiation, airborne effluents, liquid effluents, and cleared real property of DOE origin.
 - 1 Compliance may be demonstrated by calculating dose to the representative person or to the maximally exposed individual (MEI);
 - 2 Determination of the representative person or the MEI must include members of the public both on DOE sites and off DOE sites.
 - 3 Dose to the lens of the eye, skin, and extremities must be calculated if the TED for members of the public exceeds 25 mrem (0.25 mSv) in a year, or if it is suspected that any of the dose limits specified in paragraph b(1)(a) of the Specific Requirements in this CRD may be exceeded.
 - (b) Analytical models that consider likely exposure pathways, such as:
 - 1 Direct external radiation from sources located on-site;
 - 2 External radiation from airborne radioactive material;
 - 3 External radiation from radioactive material deposited on surfaces off-site;
 - 4 Internal radiation from inhaled airborne radioactive material;

- 5 Internal radiation from radioactive material ingested with food from terrestrial crops or animal products (e.g., meat, eggs, milk);
 - 6 Internal radiation from radioactive material ingested with aquatic food products such as fish, shellfish, crustaceans (e.g., crayfish, shrimp, crab, lobsters), and aquatic plants and algae;
 - 7 External or internal radiation due to residual radioactive material on, or in, cleared real property; and
 - 8 Any other pathway unique to the DOE site or activity.
- (c) The dose to members of the public from DOE-related exposure sources only, if the projected DOE-related dose to the representative person or MEI is 25 mrem (0.25mSv) in a year or less. If the DOE-related dose is greater than 25 mrem in a year, the dose to members of the public must include both major non-DOE sources of exposure (excluding background radiation dose, occupational doses and doses due to medical exposures) and dose from DOE-related sources;
- (d) Collective dose for members of the public resulting from radiation emitted and radioactive materials released from DOE radiological activities only (not including radon and its decay products). Collective dose for members of the public must be representative of the total dose and of adequate quality for supported comparisons, trending or decisions. Consistent with the graded approach, collective dose estimates may be truncated by distance (e.g., 50 miles) or individual dose level (e.g., 10 microrem) when integration of doses beyond such thresholds does not significantly affect data quality objectives. Where it is of concern, collective dose for members of the public resulting from radon and its decay products released by DOE radiological activities needs to be calculated separately from other radionuclides.
- (2) The estimated dose to the MEI or representative person must be based on pathway and exposure parameters for a highly exposed individual or individuals but be as realistic as practicable and not likely to substantially underestimate or overestimate the dose. Collective dose (population dose) must also be as realistic as practicable but is an estimate of the sum of the doses to all members of the actual exposed population.
- (3) Site-specific information on radiation source dispersion patterns, location and demography of members of the public in the vicinity of DOE radiological activities, land use, food supplies, and exposure pathway

information must be updated, as necessary, to document significant changes that could affect dose evaluations.

- (4) Values of assumed default or site-specific parameters used in calculations must be identified and included with the documentation of the calculations.
- (5) Direct measurements must be made, to the extent practicable, to obtain information characterizing source terms, exposures, exposure modes, and other information needed in evaluating dose.
- (6) Dose evaluation models that are codified or approved for use by DOE must be used. Alternative dose evaluation models, including those used by other regulatory agencies, national organizations or international organizations must be approved for use by either the Chief Health, Safety and Security Officer or by the DOE Field Element Manager with the concurrence of a Cognizant Secretarial Officer and the Chief Health, Safety and Security Officer.
- (7) DOE-approved dose coefficients must be used to evaluate doses resulting from DOE radiological activities. Use of alternative dose coefficients must be approved by the Chief Health, Safety and Security Officer or by a Cognizant Secretarial Officer in consultation with the Chief Health, Safety and Security Officer.

Doses to members of the public from airborne effluents must be evaluated with the CAP-88 model or other EPA-approved model or method to demonstrate compliance with applicable subparts of 40 CFR Part 61, *National Emission Standards for Hazardous Air Pollutants*.

- f. The contractor must establish and implement procedures and practices related to airborne radioactive effluents so that radiological activities are conducted in a manner such that the release of radioactive material to the atmosphere will:
 - (1) Be evaluated using the ALARA process established in paragraph 2d(2) of this CRD;
 - (2) Not cause annual radon-222 flux rates to exceed $20 \text{ pCi (0.7 Bq) m}^{-2} \text{ sec}^{-1}$ averaged over the surface area overlaying waste, including the covering or other confinement structures, wherever radium-226 wastes are accepted for storage or disposal (See 40 CFR Part 61, Subparts Q and T);
 - (3) Meet compliance agreements under 40 CFR Part 61, Subparts H, Q, and T;
 - (4) Not cause the radon-220 and radon-222 decay product concentration, including background, to exceed 0.03 WL in buildings that can be occupied. Further, a reasonable effort must be made to meet a 0.02WL

generic guideline for annual average radon-220 and radon-222 decay product concentration, including background, in such buildings; and

- (5) Not exceed 3 pCi/L annual average radon-220 and radon-222 concentration, not including background, at the site boundary if DOE activities release radon-220 and radon-222 or their decay products.
- g. The contractor must establish and implement procedures and practices related to control and management of radionuclides from DOE activities in liquid discharges. Operators of DOE facilities discharging or releasing liquids containing radionuclides from DOE activities must:
- (1) Characterize planned and unplanned releases of liquids containing radionuclides from DOE activities – consistent with the potential for on- and off-site impacts – and provide an assessment of radiological consequences as necessary to demonstrate compliance with the Specific Requirements of this CRD.
 - (2) Comply with the ALARA process requirements in paragraphs d(2) and (3) of the Specific Requirements in this CRD.
 - (3) Conduct activities to ensure that liquid releases containing radionuclides from DOE activities are managed in a manner that protects ground water resources now and in the future, based on use and value considerations.
 - (4) Conduct activities to ensure that liquid releases containing radionuclides from DOE activities to natural waterways do not exceed either of the following:
 - (a) 5 pCi (0.2 Bq) per gram above background of settleable solids for alpha-emitting radionuclides.
 - (b) 50 pCi (2 Bq) per gram above background of settleable solids for beta-emitting radionuclides.
 - (5) Except for tritium and sanitary sewers, apply Best Available Technology (BAT) at the point of discharge if:
 - (a) The annual average concentration of a given radionuclide is greater than the DOE-approved DCG value for water, or for multiple radionuclides, the composite DCG must be the sum of the fractional DCG values derived from DOE-approved DCG values.
 - (b) The discharge contributes greater than 10 mrem (0.1 mSv) annual TED to members of the public; or

- (c) The collective dose from all DOE sources is greater than 100 person-rem (1 person-Sv) and the liquid discharge contributes 50 percent or more of this collective dose.
- (6) Control releases of tritium in a manner that has been established by application of the ALARA process.
- (7) Conduct radiological activities to ensure that radionuclides from DOE activities contained in liquid effluents do not cause private or public drinking water systems to exceed the drinking water maximum contamination limits in 40 CFR Part 141, *National Primary Drinking Water Regulations*.
- (8) Control discharges into sanitary sewers in accordance with the following requirements:
 - (a) Except for excreta from patients treated with radioactive material, discharges of liquids containing radionuclides from DOE activities into non-Federally owned sanitary sewers are prohibited unless:
 - 1 The material is readily soluble (or readily dispersed biological materials) in water;
 - 2 Such discharges comply with ALARA process requirements;
 - 3 BAT is applied to discharges of liquid releases containing radionuclides from DOE activities if the average monthly concentration level at the point of discharge into the sanitary sewer is greater than five times the DOE-approved DCG values for ingestion;
 - 4 Releases do not result in an annual discharge (above background) into sanitary sewers in excess of 5 Ci (185 GBq) of tritium; 1 Ci (37 GBq) carbon-14 or 1 Ci (37 GBq) of all other radionuclides combined;
 - 5 DOE operations are conducted to minimize long-term buildup of radionuclides in the sewage treatment plants that may create handling and disposal issues or interfere with plant operations;
 - 6 The contractor notifies the responsible Field Element Manager of unusual discharges to sanitary sewers from DOE facilities;

- 7 The contractor prepares and provides a report that describes and summarizes such discharges to sanitary sewers to the responsible Field Element Manager at least annually; and
 - 8 Existing agreements, contracts, statements of understanding or other formal arrangements with other agencies concerning the discharge of liquids containing radionuclides from DOE activities to sanitary sewers are not violated.
 - (b) DOE facilities discharging liquids containing radionuclides from DOE activities into sanitary sewer systems owned by the Federal government are not subject to the requirements in paragraph 2.g(8)(a) of the Specific Requirements in this CRD if:
 - 1 The system provides treatment in accordance with an approved ERPP and
 - 2 Sludge from the system is disposed of in accordance with the Specific Requirements in this CRD and applicable Federal, State, and municipal regulations.
- (9) Prohibit the use of soil columns.
- (10) Manage the disposition of non-process water potentially containing radionuclides from DOE activities to protect soil and ground water and prevent the creation of future cleanup sites.
- (11) Ensure that storm water runoff containing radionuclides from DOE activities meets the requirements in paragraph 2.g of this CRD. Additionally, the receiving ecosystem including but not limited to, wetlands, floodplains, streams, ponds, basins and lakes must be monitored to evaluate human or ecological impacts.
- h. The contractor must establish and implement procedures and practices to ensure that management, storage and disposal of radioactive waste and spent nuclear fuel address the following elements:
 - (1) Radiological activities must be conducted in a manner such that radiation exposure to members of the public from radioactive waste complies with ALARA process requirements and does not result in a TED greater than 25 mrem (0.25 mSv) in a year from all exposure pathways and radiation sources associated with the waste, except radon and its decay products.
 - (2) Management of spent nuclear fuel, and high-level and transuranic wastes at a disposal facility which is not regulated by the NRC must comply with the requirements of DOE O 458.1 and 40 CFR Part 191,

Environmental Radiation Protection Standards for Management and Disposal of Spent Nuclear Fuel, High-level and Transuranic Radioactive Wastes. The management of high-level and transuranic wastes at DOE facilities that are not licensed by NRC must comply with the requirements of DOE O 435.1, *Radioactive Waste Management*, dated 7-9-99, and DOE M 435.1-1, *Radioactive Waste Management Manual*, dated 7-9-99, and may use the guidance in DOE M 435.1-1 and DOE G 435.1-1, *Implementation Guide for Use with DOE M 435.1*, dated 7-9-99.

- (3) Management and disposal of low-level radioactive waste must be conducted in a manner such that exposure to members of the public to radiation from radioactive waste complies with ALARA process requirements, and does not exceed a TED of 25 mrem (0.25 mSv) in a year from all exposure pathways and radiation sources associated with the waste, except radon and its decay products. Management, storage, and disposal of low-level radioactive waste must comply with the requirements contained in DOE O 435.1 and DOE M 435.1-1.
- (4) Management and disposal of byproduct material, as defined in Section 11e.(2) of the AEA and other wastes containing uranium and thorium and their decay products which are not subject to the requirements of 40 CFR Part 192, *Health and Environmental Protection Standards for Uranium and Thorium Mill Tailings*, are not at facilities licensed by the Nuclear Regulatory Commission, or are not disposed of at DOE low-level waste disposal facilities must be in accordance with the requirements of paragraph 2.h of this CRD and DOE-approved plans.
 - (a) Disposal facilities for uranium and thorium wastes must be designed to:
 - 1 Remain effective for one thousand years, to the extent reasonably achievable, and, in any case, for at least 200 years, and
 - 2 Provide reasonable assurance that releases of radon-222 to the atmosphere will not:
 - a Exceed an average release rate of 20 picocuries per square meter per second or
 - b Increase the annual average concentration of radon-222 in air at or above any location outside the disposal site by more than one-half picocurie per liter.

- (b) For wastes containing significant concentrations of radium and thorium, special considerations must be given to intruder prevention.
 - (c) Before any potentially biodegradable contaminated wastes are placed in a disposal facility, such wastes must be conditioned so that the generation and escape of biogenic gases will not cause the emission or dose limits in paragraph 2h of this CRD to be exceeded and that bio-degradation within the facility will not result in premature structural failure.
 - (d) All plans for the management and disposal of these wastes must be consistent with DOE P 454.1 and in accordance with DOE O 430.1 in regards to institutional controls and long-term stewardship of the disposal facility.
- (5) Discrete sources of radium-226, accelerator produced material, or naturally-occurring radioactive material (NORM) that pose a threat similar to discrete sources of radium-226, which are defined as 11e.(3) or 11e.(4) byproduct material in the AEA, must be managed as high-level waste, low-level waste or 11e.(2) material as appropriate under DOE AEA authorities and in compliance with the Specific Requirements in this CRD and the requirements of DOE O 435.1.
- i. The contractor must establish and implement procedures and practices to ensure that DOE sites provide a level of radiation protection for persons consuming water from a public drinking water system operated by DOE, directly or through a DOE contractor, which is equivalent to that provided to members of the public by the community drinking water standards of 40 CFR Part 141, *National Primary Drinking Water Regulations*.
- j. The contractor must establish and implement procedures and practices to ensure that biota are protected and to address the following elements:
 - (1) Radiological activities that have the potential to impact the environment must be conducted in a manner that protects populations of aquatic animals, terrestrial plants, and terrestrial animals in local ecosystems from adverse effects due to radiation and radioactive material released from DOE operations.
 - (2) Radiological activities that cause direct radiation of the environment, or that discharge or otherwise release radioactive material into the environment must demonstrate compliance with paragraph 2.j(1) of this CRD in one of the following ways:
 - (a) Use DOE-STD-1153-2002, *A Graded Approach for Evaluating Radiation Doses to Aquatic and Terrestrial Biota* to demonstrate

that the dose rates to representative biota populations do not exceed the dose rate criteria in paragraph 2.j(3) of this CRD;

- (b) Use a DOE-approved alternative approach to demonstrate that the dose rates to representative biota populations do not exceed the dose rate criteria in paragraph 2.j(3) of this CRD; or
- (c) Conduct an ecological risk assessment, using DOE-approved procedures to demonstrate that radiation and radioactive material released from DOE operations will not adversely affect populations within the ecosystem.

(3) Dose Rate Criteria

Table 1. Protection of Biota Criteria*

Biota Criteria	Absorbed Dose Rate (rad/day)	Absorbed Dose Rate (mGy/day)
Aquatic Animals	1	10
Terrestrial Plants	1	10
Terrestrial Animals	0.1	1

* See DOE-STD-1153-2002 for basis of biota dose rate criteria

- k. The contractor must establish and implement procedures and practices to ensure that clearance of any property with the potential to contain residual radioactive material must be conducted in accordance with DOE direction and in accordance with the requirements in paragraph 2.k of this CRD⁶.
 - (1) Property control and clearance processes must be developed and implemented in accordance with the dose limits in paragraph 2.b under any plausible use of the property and the ALARA process requirements in paragraph 2.d of this CRD are met before property is cleared.
 - (2) Dose Constraints. Unless alternative dose constraints are approved by issuance of a directive or memorandum by the Chief Health, Safety and Security Officer, or for NNSA, the Cognizant Secretarial Officer in consultation with the Chief Health, Safety and Security Officer, the following dose constraints for DOE residual radioactive material must be applied to each specific clearance of property for any actual or likely future use of the property:

⁶ In addition to paragraph 2.k of this CRD, the following DOE property control requirements may have applicable requirements regarding clearance of property: 41 CFR Chapter 109, *Department of Energy Property Management Regulations*; DOE O 430.1B, *Real Property Asset Management*; DOE O 580.1, *Department of Energy Personal Property Management Program*.

- (a) Real property – a TED of 25 mrem (0.25 mSv) above background in any calendar year;
 - (b) Personal property - a TED of 1 mrem (0.01 mSv) above background in any calendar year.
- (3) Residual Radioactive Material. Property potentially containing residual radioactive material must not be cleared from DOE control unless either:
 - (a) The property is demonstrated not to contain residual radioactive material based on process and historical knowledge, radiological monitoring or surveys, or a combination of these; or
 - (b) The property is evaluated and appropriately monitored or surveyed to determine:
 - 1 The types and quantities of residual radioactive material within the property;
 - 2 The quantities of removable and total residual radioactive material on property surfaces (including residual radioactive material present on and under any coating);
 - 3 That for property with potentially contaminated surfaces that are difficult to access for radiological monitoring or surveys, an evaluation of residual radioactive material on such surfaces is performed which is:
 - a Based on process and historical knowledge meeting the requirements of paragraph k(5) of the Specific Requirements in this CRD and monitoring and or surveys, to the extent feasible and
 - b Sufficient to demonstrate that applicable specific or pre-approved DOE Authorized Limits will not be exceeded; and
 - 4 That any residual radioactive material within or on the property is in compliance with applicable specific or pre-approved DOE Authorized Limits.
- (4) Evaluation of the Need of Real Property for Maintaining Institutional Controls. Real property under evaluation for clearance from DOE radiological controls must be evaluated against its need for maintaining institutional controls or impacting long-term stewardship of adjacent DOE real property. In situations where transfer of the real property to other use would impact long-term radiological protection of adjacent DOE

properties, it must be demonstrated that the impact of the property clearance would not result in noncompliance for the adjacent property with the requirements of applicable statutes, regulations or DOE directives.

- (5) Process and Historical Knowledge. The contractor must establish an evaluation process for applying process and historical knowledge to determine if property potentially contains residual radioactive material.
 - (a) This process must include procedures for evaluating operational records, operating history, and process knowledge including use of any radioactive materials or radiation generating devices.
 - (b) For real property, this process must address each specific property individually. If several parcels of land are contiguous, or if several structures are located in the same area and have a common operational history, a single evaluation for all of the properties is acceptable.
 - (c) For personal property, a single evaluation for properties with a common use, location, or process knowledge may be used.
 - (d) If available process and historical knowledge cannot demonstrate that property does not contain residual radioactive materials, radiological monitoring or surveys must be conducted to supplement process and historical knowledge evaluations.
 - (e) Process and historical knowledge evaluations must be adequate to determine:
 - 1 Whether the property has ever been used for radiological activities or in areas that could have resulted in the presence of residual radioactive material within or on the property; or
 - 2 Whether property formerly containing residual radioactive material has been decontaminated and demonstrated to meet DOE Authorized Limits, and has not been used in a manner or in areas that could have resulted in the re-contamination of the property.
 - (f) For property that is determined to potentially contain residual radioactive material under paragraph 2.k.(5)(e)1 of the Specific Requirements in this CRD or determined to be re-contaminated under paragraph 2.k.(5)(e)2 of the Specific Requirements in this

CRD, the process and historical knowledge evaluation must also include an assessment of the types and quantities of residual radioactive material and the sources and pathways by which the property became contaminated.

- (g) Process and historical knowledge evaluation procedures must be described in the ERPP documentation.

(6) Authorized Limits.

- (a) Authorized Limits must be established and approved for the clearance of any property with potential to contain residual radioactive material to provide reasonable assurance that the requirements of paragraphs k(1) and k(2) of the Specific Requirements in this CRD are met.

- (b) Authorized Limits must:

- 1 Be developed in accordance with the ALARA requirements in paragraph 2.d of this CRD.
- 2 Be based on the applicable dose constraint, supported by a complete exposure pathway analysis using methodologies, techniques, and parameters approved by a Cognizant Secretarial Officer, in consultation with the Chief Health, Safety and Security Officer.
- 3 Be expressed in terms of concentration of radioactivity per unit surface area (e.g., dpm per 100 cm²) or per unit mass or volume (e.g., pCi per gram), or total radioactivity, or DOE controls and restrictions, if applicable.
- 4 Explicitly state any restrictions or conditions on future use of the property necessary to ensure the basic dose limit and applicable dose constraint are not exceeded.
- 5 In addition to paragraphs k(6)(c)1-4 of the Specific Requirements in this CRD for clearance of personal property only:
 - a Be based on expected annual quantity of property to be cleared; or,
 - b Be based on expected total amount of property cleared over the life of the project for specific

remedial action or decontamination and decommissioning projects, and

- c Prior to clearance of metals, the contractor must provide the necessary information to support a determination by the Field Element Manager that there is no practical internal DOE opportunity for reuse or recycle of the material or equipment.

(c) Applications for DOE approval of Authorized Limits must contain the following:

- 1 A description of the property;
- 2 Specific limits proposed for each radionuclide or group of radionuclides and/or external radiation exposure, surrogate metrics, or conditions used to limit radionuclides;
- 3 Potential collective dose to the exposed population and the potential dose to a member of the public most likely to receive the highest dose for both: 1) actual and likely future use and 2) plausible future use of the property;
- 4 ALARA assessments conducted under paragraph 2.d of this CRD for the proposed clearance action to include, at a minimum, the effects of:
 - a Implementing the proposed Authorized Limits;
 - b Implementing levels of residual radioactive material other than the proposed Authorized Limits;
 - c Not implementing the proposed Authorized Limits, i.e., not proceeding with the proposed clearance action.
- 5 A description of the procedures and radiological monitoring or surveys to be used to demonstrate compliance with proposed limits.
- 6 Identification of any restrictions or conditions on the future use of the property upon which the proposed limits are based, and the means by which the restrictions or conditions will be implemented and maintained.

7 An estimated date for when the property is cleared and an estimate of when the property will be released from DOE control.⁷

- (d) Property covered by Authorized Limits is subject to 10 CFR Part 835 requirements unless the criteria in paragraphs k(6)(a) through (c) of the Specific Requirements in this CRD have been met and the Authorized Limits have been approved by a Cognizant Secretarial Officer in consultation with the Chief Health, Safety and Security Officer as required by the 10 CFR Part 835 exclusion.
- (e) Revision of Authorized Limits. If established Authorized Limits are found to be not protective, appropriate or practical to apply for a specific type or portion of property, further clearance for that specific type or portion of property must not proceed without revised Authorized Limits.

1 An application for a revised Authorized Limit must be submitted in accordance with the requirements in paragraphs 2.k(6)(a) through (d) of the Specific Requirements in this CRD.

2 In addition to the requirements of applicable paragraphs of 2.k(5) of the Specific Requirements in this CRD, requests for approval of revised Authorized Limits must include a justification for the need for the revised Authorized Limits. Justifications for revised Authorized Limits must be based upon one of the following:

- a Complying with existing Authorized Limits would pose a clear and present risk of injury to general employees or members of the public; or
- b Complying with existing Authorized Limits, would produce environmental harm (e.g., destruction of artifacts, ecological damage, loss of cultural assets) that is clearly excessive compared to the potential health benefits to persons exposed to affected properties; or
- c Complying with existing Authorized Limits is unreasonably costly relative to long-term benefits

⁷ This information is needed to support the DOE expectation stated at 72 FR 31906 (10 CFR Part 835, June 8, 2007) that the material, equipment, or real property to which the 10 CFR Part 835.1(b)(6) exclusion is applied will be released from DOE control according to a specified time interval.

and where the residual radioactive material does not pose a clear present or future potential of exceeding the public dose limit of paragraph 2.b of this CRD; or

- d Portions of the project or activity for which the scenarios or assumptions used to establish the existing Authorized Limits are overly conservative, or where more appropriate scenarios or assumptions indicate that other limits are applicable or appropriate for protection of the public and the environment; or
- e New information which indicates the existing Authorized Limits are not sufficient to meet the protective requirements established by DOE.

(f) Pre-Approved Authorized Limits.

1 The following values have been pre-approved by DOE for use as Authorized Limits, and may be used instead of developing specific Authorized Limits if the responsible DOE Field Element Manager approves their use:

- a For radium-226 and radium-228 in soil - 5 pCi/gram (0.2 Bq/gram) in excess of background levels, averaged over 100 m², in the first 15 cm depth of the surface layer of soil; and 15 pCi/gram (0.56 Bq/gram) in excess of background levels, averaged over any subsequent 15 cm subsurface layer of soil plus an ALARA assessment. If both thorium-230 and radium-226 or both thorium-232 and radium-228 are present and not in secular equilibrium, the appropriate pre-approved limit must be applied to the radionuclide with the higher concentration.
- b Guidelines and limits previously derived from DOE Order 5400.5 and associated guidance (such as the surface activity guidelines) may continue to be applied and used as Pre-Approved Authorized Limits until they are replaced or revised by Pre-Approved Authorized Limits issued by the Department.

2 Other Pre-Approved Authorized Limits must be approved by the Chief Health, Safety and Security Officer or the

responsible Cognizant Secretarial Officer in consultation with the Chief Health, Safety and Security Officer.

- a The approvals may be made through a DOE memorandum but must be included in a DOE directive issued under DOE O 251.1C or a Technical Standard under DOE O 252.1 within eighteen months of issuance.
 - b Pre-Approved Authorized Limits must provide reasonable expectation that their implementation will comply with the requirements in paragraphs 2.k(1) and 2.k(2) of the Specific Requirements of this CRD.
 - c The scope of applicability (e.g., property, activities, or radionuclides) and conditions of, or restrictions on, their use must be documented.
- 3 Pre-Approved Authorized Limits may be used for any radiological activity instead of developing specific Authorized Limits if their use is documented in the ERPP and approved by the responsible Field Element Manager.
- (g) Documentation of Approved Authorized Limits. Approved Authorized Limits and approved revised Authorized Limits and supporting documentation must be made available to the public.
- (7) Clearance of Environmental Restoration, Decommissioning and Other Cleanup Materials.
 - (a) Clearance of property with residual radioactive material from environmental restoration activities, including decommissioning, must meet the Specific Requirements in this CRD. Environmental restoration activities using the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) process (in accordance with Executive Order 12580) may demonstrate compliance with the Specific Requirements in this CRD (including general employee and public dose assessments, ALARA analysis, and consideration of scenarios) through the CERCLA process.
 - (b) For the purpose of clearance of real or personal property, approved CERCLA remediation criteria may be considered equivalent to Authorized Limits if the appropriate Field Element Manager has determined that the criteria meet the Specific Requirements in this CRD for Authorized Limits, and provided that the use of the criteria as DOE Authorized Limits is documented and approved as

would be an Authorized Limit. Compliance with all Specific Requirements in this CRD not met through the CERCLA process must also be demonstrated.

- (c) If the contractor performs environmental restoration activities involving clearance of real or personal property with residual radioactive material under the CERCLA process that use the CERCLA analysis and documentation in lieu of DOE O 458.1-specific analysis and documentation to demonstrate compliance with the Specific Requirements in this CRD, the contractor must submit the decision document, such as the Record of Decision, or any other document that serves as authorization for the clearance action, and any additional information necessary to demonstrate that the CERCLA remediation criteria meet the requirements for Authorized Limits, to the responsible Field Element Manager.

(8) Radiological Monitoring or Surveys.

- (a) All radiological monitoring or surveys performed in support of clearance of property must:
 - 1 Use methodologies that have been approved for clearance of property by either a Cognizant Secretarial Officer or the Chief Health, Safety and Security Officer;
 - 2 Meet Measurement Quality Objectives approved by a Cognizant Secretarial Officer;
 - 3 Use DOE-approved sampling and analysis techniques, if applicable; and
 - 4 Include an evaluation of non-uniformly distributed residual radioactive material, if applicable.
- (b) Instrumentation used for radiological monitoring or surveys must be capable of detecting and quantifying residual radioactive material consistent with the applicable Authorized Limits, and be:
 - 1 Periodically maintained and calibrated on an established frequency;
 - 2 Appropriate for the type(s), levels, and energies of the radiation(s) encountered; and
 - 3 Appropriate for existing environmental conditions; and routinely tested for operability.

- (9) Documentation and Verification. The contractor must ensure that final radiological monitoring or surveys are conducted and that documentation is prepared that shows that the clearance meets applicable DOE Authorized Limits, or other applicable requirements. The need for and plans to implement any necessary restrictions or institutional controls consistent with DOE P 454.1 are a necessary part of the documentation.
- (10) Public Notification of Clearance of Property. Information on approved Authorized Limits, any approved revised Authorized Limits, use of pre-approved Authorized Limits, results of radiological monitoring and surveys of cleared property with type and quantity of property cleared, and Independent Verification (IV) program results must be summarized in the Annual Site Environmental Report.
- (11) Final Clearance Documentation. Clearance of property must be documented. The contents of the documentation or the mechanism for documenting information may be tailored to the need, situation, and type of property being cleared. For ongoing, routine clearances, e.g., clearance of individual and personal property from controlled areas, such documentation may be based on the general process(es) rather than each specific clearance. In general, the documentation must describe the clearance process(es) and the property being cleared. The documentation must indicate any Authorized Limits, including any revised or pre-approved Authorized Limits, used for the clearance, and include information and data supporting the clearance of property such as radiological certification and IV program results including:
 - (a) Introduction (describe the clearance scenario, concisely explaining why the property was eligible for radiological clearance);
 - (b) Description of the property;
 - (c) Radiological history of the property;
 - (d) Remedial action history of the property;
 - (e) Final radiological conditions;
 - (f) Description of any dose assessment(s) for the property which:
 - 1 Identifies the clearance criteria for the property,
 - 2 Describes the bases for the criteria,
 - 3 Documents DOE's approval of the clearance criteria, and documents that the clearance criteria are consistent with applicable State and Federal requirements;

- (g) Identification of any restrictions on use or disposition of the property and the specific process or means that provide a reasonable expectation that the restrictions or controls will be implemented;
 - (h) Description of any radiological monitoring or surveys of the property to include the date(s) of the monitoring or surveys, the identity of the surveyor(s), the types and identification numbers of the instruments used, and the results of the monitoring or surveys;
 - (i) ALARA analysis demonstrating that further remediation or decontamination is not warranted;
 - (j) The identity of the recipient of the property, the property destination, or the property's disposition, as appropriate;
 - (k) Summary and Conclusions;
 - (l) References (if applicable); and
 - (m) Attachments (if applicable).
1. Records, Retention and Reporting Requirements. The contractor must establish and implement recordkeeping, retention and reporting procedures and practices to ensure that the following elements are addressed:
- (1) Records must be maintained to document compliance with the Specific Requirements in this CRD.
 - (2) Required records include the following:
 - (a) Information and data necessary to identify and characterize releases of radioactive material to the environment, their fate in the environment, and their probable impact on radiation dose to members of the public, and any impacts on ecological systems.
 - (b) Documentation of individual and collective dose to members of the public due to radiological activities. This includes documentation of site-specific information on radiation source dispersion patterns, location and demography of members of the public in the vicinity of the radiological activity and assumed default values or site-specific parameters used in calculations.
 - (c) Requests for specific authorization for temporary public dose limits, and subsequent approvals and other related actions.

- (d) Identification of existing or anticipated radiological activities subject to ERPP requirements, and descriptions of the measures to be used in implementing these ERPP requirements.
- (e) Documentation of actions taken to implement the ALARA process identified in paragraph 2.d of the Specific Requirements in this CRD.
- (f) Documentation of actions taken to demonstrate compliance with the public dose limit (See paragraph 2.e(1) of the Specific Requirements in this CRD).
- (g) Documentation of actions taken to implement the BAT selection process in regulating liquid discharges, including documentation of analyses and factors considered to be important, including alternative processes, for the BAT selection process.
- (h) Effluent monitoring and environmental surveillance information and data, including:
 - 1 Results of effluent monitoring for determining sources of radiation and radioactive material that provide direct exposure to members of the public and releases of radioactive material in liquid or airborne effluent;
 - 2 Results of surveys for radiation and radioactive material in the environment;
 - 3 Results of surveys, measurements, and calculations used to determine the dose to members of the public and ecological receptors from external and internal radiation sources;
 - 4 Meteorological data used in assessing dose; and
 - 5 Results of pre-operational monitoring.
- (i) Documentation related to the long-term management of radioactive waste and residual radioactive material.
- (j) Final documentation for clearance of property containing residual radioactive material.
- (k) Documentation of:
 - 1 Approved Authorized Limits for routine clearance of property for unrestricted or restricted use and the scenarios evaluated in selecting the limits; and

2 Approved revised Authorized Limits for clearance of property.

- (3) Records required by the Specific Requirements in this CRD must be maintained by, or transferred to, DOE upon cessation of a DOE radiological activity at a site.
- (4) Unless otherwise specified in DOE rules or directives, records must be retained until final disposition is authorized by DOE in accordance with DOE O 243.1, *Records Management Program*, dated 2-3-06.
- (5) Reporting.
 - (a) Reporting requirements are contained in DOE M 231.1-2, *Occurrence Reporting and Processing of Operations Information*, dated 8-19-03 and DOE M 231.1-1A, *Environment, Safety and Health Reporting Manual*, dated 3-19-04.
 - (b) The contractor must notify the Field Element Manager within 30 calendar days when it has been identified that any Specific Requirement in this CRD not required to be reported under paragraph (5)(a) has not been met.
- (6) Units. Unless otherwise specified, the quantities used in the reports and records required by the Specific Requirements of this CRD must be clearly indicated in special units of curie, rad, roentgen, or rem, including multiples and subdivisions of these units, or other conventional units, such as dpm, dpm/100 cm², or mass units. The SI units, and becquerel (Bq), gray (GY), and sievert (Sv) may be provided parenthetically for reference with scientific standards.

3. DEFINITIONS: See Attachment 2.

DEFINITIONS

1. Absorbed Dose (D) — The average energy imparted by ionizing radiation to the matter in a volume element. The absorbed dose is expressed in units of rad (or gray) (1 rad = 0.01 gray).
2. Actual or Likely Use Scenarios — The reasonably anticipated future uses of land or property considering the history of use and implementable use restrictions, designations or controls; affected populations, or ecosystems, natural resources, or historic or cultural significance. For real property considerations also include Federal and State use designations; local zoning and future land use plans; and proximity to residences, commercial, industrial or unique cultural or historic areas.
3. Airborne Discharges — Material released to the atmosphere in the form of dusts, fumes, particulates, mists, vapors, or gases.
4. ALARA (As Low As Reasonably Achievable) — An approach to radiation protection to manage and control releases of radioactive material to the environment, and exposure to the work force and to members of the public so that the levels are as low as is reasonably achievable, taking into account societal, environmental, technical, economic, and public policy considerations. As used in this Order, ALARA is not a specific release or dose limit but a process which has the goal of optimizing control and management of releases of radioactive material to the environment and doses so that they are as far below the applicable limits of the Order as reasonably achievable.
5. ALARA Process — A graded process for evaluating alternative operations, processes, and other measures, for optimizing releases of radioactive material to the environment, and exposure to the work force and to members of the public taking into account societal, environmental, technical, economic, and public policy considerations to make a decision concerning the optimum level of public health and environmental protection.
6. Authorized Limit — A limit on or conditions or measures that limit and control the concentration of residual radioactive material on the surfaces or within property that has been derived consistent with DOE directives including the as low as is reasonably achievable (ALARA) process requirements, given the anticipated use of the property and has been authorized by DOE to permit the clearance of the property from DOE radiological control.
7. Background — Radiation exposure from: (1) naturally occurring radioactive materials which have not been technologically enhanced (i.e., background does not include TENORM); (2) cosmic sources; (3) global fallout as it exists in the environment (such as from the testing of nuclear explosive devices); (4) radon and its decay products in concentrations or levels existing in buildings or the environment which have not been elevated as a result of current or prior activities; and (5) consumer products containing nominal amounts of radioactive material or producing nominal amounts of radiation.

8. Best Available Technology (BAT) — The preferred technology for a particular activity, selected from among others after taking into account factors related to technology, economics, public policy, and other parameters. As used in this Order, the BAT is not a specific level of treatment, but is the conclusion of a selection process in which several alternatives are evaluated.
9. BAT Selection Process — The evaluation of candidate alternative technologies in order to select the BAT after considering: technology; economics; the age of equipment and facilities involved; the process employed; the engineering aspects of the application of various types of control techniques; process changes; other environmental impacts (including energy requirements); safety considerations; and policy considerations.
10. Clearance of Property — The removal of property that contains residual radioactive material from DOE radiological control under 10 CFR Part 835 and DOE O 458.1, or where a restricted or designated use Authorized Limit defines specific necessary limited controls or actions.
11. Collective Dose — The sum of the effective dose to all persons in a specified population received in a specified period of time. For clearance of property the collective dose refers to the population potentially exposed to the cleared property. Collective dose is expressed in units of person-rem (or person-sievert).
12. Committed Effective Dose (E_{50}) — The sum of the committed equivalent doses to various tissues or organs in the body ($H_{T,50}$), each multiplied by the appropriate tissue weighting factor (w_T)--that is, $E_{50} = \sum w_T H_{T,50} + w_{\text{Remainder}} H_{\text{Remainder},50}$, where $w_{\text{Remainder}}$ is the tissue weighting factor assigned to the remainder organs and tissues and $H_{\text{Remainder},50}$ is the committed equivalent dose to the remainder organs and tissues. Committed effective dose is expressed in units of rems (or sieverts).
13. Committed Equivalent Dose ($H_{T,50}$) — The equivalent dose calculated to be received by a tissue or organ over a 50-year period after the intake of a radionuclide into the body. It does not include contributions from radiation sources external to the body. Committed equivalent dose is expressed in units of rems (or sieverts).
14. Controlled Area — Any area to which access is managed by or for DOE to protect individuals from exposure to radiation and/or radioactive material as defined by 10 CFR Part 835.
15. Derived Concentration Guide (DCG) — The derived concentration value for a radionuclide in water that would result in a dose of 100 mrem in a year to a gender- and age- weighted reference person using DOE approved dose conversion factors and assuming continuous exposure.
16. Dose — A general term for absorbed dose, equivalent dose, effective dose, committed equivalent dose, committed effective dose, or TED as defined in this Order.

17. Effective Dose (E) — The summation of the products of the equivalent dose received by specified tissues or organs of the body (H_T) and the appropriate tissue weighting factor (w_T)--that is, $E = \sum w_T H_T$. It includes the dose from radiation sources internal and/or external to the body. For purposes of compliance with this Order, equivalent dose to the whole body may be used as effective dose for external exposures. The effective dose is expressed in units of rems (or sieverts).
18. Effluent Monitoring — The collection and analysis of samples or measurements of liquid and gaseous effluents for purposes of characterizing and quantifying radiological contaminants and process stream characteristics, assessing radiation exposure of members of the public, and demonstrating compliance with applicable standards.
19. Environmental Surveillance — The collection and analysis of samples of air, water, soil, foodstuffs, biota, and other media from DOE sites and their environs and the measurement of external radiation for purposes of demonstrating compliance with applicable standards, assessing radiation exposure of members of the public, and assessing effects, if any, on the environment.
20. Equivalent Dose (H_T) — The product of average absorbed dose ($D_{T,R}$) in rad (or gray) in a tissue or organ (T) and a radiation (R) weighting factor (w_R). For external dose, the equivalent dose to the whole body is assessed at a depth of 1 cm in tissue; the equivalent dose to the lens of the eye is assessed at a depth of 0.3 cm in tissue, and the equivalent dose to the extremity and skin is assessed at a depth of 0.007 cm in tissue. Equivalent dose is expressed in units of rems (or sieverts).
21. External Dose or Exposure — That portion of the dose received from radiation sources outside the body (i.e., external sources).
22. Facility - Something that is built, installed, or established to serve a particular DOE radiological activity.
23. General Employee — An individual who is either a DOE or DOE contractor employee; an employee of a subcontractor; or an individual who performs work for or in conjunction with DOE or utilizes DOE facilities.
24. Internal Dose or Exposure — That portion of the dose received from radioactive material taken into the body (i.e., internal sources).
25. Liquid Discharge — The release to the environment of radioactive material in a liquid medium. The discharge generally occurs at a point, such as the end of a pipe, where it is released to any of several receptors in the environment, such as a waterway, land, sewer system, etc. However, it could be the result from sheet flow, such as storm runoff.
26. Maximally Exposed Individual — A hypothetical individual who – because of realistically assumed proximity, activities, and living habits – would receive the highest radiation dose from a given event, process, or facility.

27. Member of the Public — An individual who is not a general employee. An individual is not a member of the public during any period in which the individual receives an occupational dose.
28. Monitoring — The measurement of radiation levels, discharges or environmental releases, residual radioactive levels, quantities of radioactive material, or exposure to members of the public and the use of the results of these measurements to evaluate radiological discharges or releases or potential and actual dose resulting from exposures to radioactive material or radiation.
29. Personal Property - Property of any kind, except for real property.
30. Potential Dose — A calculated dose based on a postulated set of exposure conditions that have a reasonable probability of occurrence.
31. Public Dose — The dose received by members of the public from exposure to radiation and to radioactive material released by a DOE radiological activity whether the exposure is within a DOE site boundary or offsite.
32. Radiation — Ionizing radiation: alpha particles, beta particles, gamma rays, X-rays, neutrons, high-speed electrons, high-speed protons, and other particles capable of producing ions. Radiation, as used in this Order, does not include non-ionizing radiation, such as radio waves or microwaves, or visible, infrared, or ultraviolet light.
33. Radiation Weighting Factor (w_R) — The modifying factor used to calculate the equivalent dose from the average tissue or organ absorbed dose; the absorbed dose (expressed in rad or gray) is multiplied by the appropriate radiation weighting factor.
34. Radioactivity — The property or characteristic of radioactive material to undergo spontaneous transformations (disintegrations or decay) with the emission of energy in the form of radiation. It means the rate of spontaneous transformations of a radionuclide. The unit of radioactivity is the curie, Ci (or becquerel, Bq).
(1 Ci = 3.7×10^{10} Bq).
35. Radiological Activity — Any activity taken for, or by, DOE that has the potential to result in releases of radioactive material to the environment or exposures of members of the public to include all doses both present and future, from clearance activities and radiation generating devices. The activity may involve a single DOE facility, or combination of facilities and operations, possibly including an entire site or no fixed site at all.
36. Real Property — Land and anything permanently affixed to the land such as buildings, fences and those things attached to the buildings, such as light fixtures, plumbing and heating fixtures, or other such items, that would be personal property if not attached.
37. Reference Person — A hypothetical aggregation of human (male and female) physical and physiological characteristics arrived at by international consensus for the purpose of standardizing radiation dose calculations.

38. Remedial Actions — Those actions, consistent with permanent remedy, taken to control or remove radiological contaminants to prevent or to minimize doses to members of the public.
39. Representative Person — An individual receiving a dose that is representative of the more highly exposed individuals in the population. This term is the equivalent of, and replaces, ‘average member of the critical group’. (Source: *ICRP Publication 103*, page 32).
40. Residual Radioactive Material — Any radioactive material which is in or on soil, air, water, equipment, or structures as a consequence of past operations or activities of the Department or its predecessors.
41. Sanitary Sewerage — A system of public sewers for carrying off waste water and refuse, but excluding sewage treatment facilities, septic tanks, and leach fields owned or operated by, or for, the Department.
42. Settleable Solids — (i) that matter in waste water which will not stay in suspension during a preselected settling period, such as one hour, but settles to the bottom; (ii) in the Imhoff cone test, the volume of matter that settles to the bottom of the cone in one hour; or (iii) suspended solids that can be removed by conventional sedimentation processes.
43. Sewer — An artificial conduit, usually underground, for carrying off waste water and refuse.
44. Site — Land or property upon which DOE facilities or activities are located and access to which is subject to DOE or DOE contractor control.
45. Site Boundary - The perimeter of a DOE site, within which DOE or a DOE contractor normally can control access or restrict activities.
46. Soil Column — An in-situ volume of soil through which liquid waste streams percolate from ponds, cribs, trenches, drain fields, or other areas or facilities used for the primary purpose of removing or retaining the suspended or dissolved radionuclides contained within the liquid process waste stream.
47. Tissue Weighting Factor (w_T) — The fraction of the overall health risk, resulting from uniform, whole body irradiation, attributable to specific tissue (T). The equivalent dose to tissue, (H_T), is multiplied by the appropriate tissue weighting factor to obtain the effective dose (E) contribution from that tissue.
48. Total Effective Dose (TED) — Sum of the effective dose (for external exposures) and the committed effective dose.
49. Whole Body — For the purposes of external exposure, head, trunk (including male gonads), arms above and including the elbow, or legs above and including the knee.

50. Working Level (WL) — The potential alpha energy concentration of radon decay products in 1 liter of air, without regard to the degree of equilibrium, that will result in the emission of 1.3×10^5 MeV of alpha particle energy.
